FARM PRODUCTION AND INCOME FROM MEAT ANIMALS

FOREWORD

This report contains the 1937 revised and 1938 preliminary estimates of inventory numbers of meat animals, production, and farm disposition, marketings and income.

The estimates are largely the work of C. L. Harlan, Principal Agricultural Statistician, and A. R. Tuttle, Agricultural Statistician, with participation and substantial contribution of data and methods by others of the Washington staff of the Bureau and by statisticians in charge of branch offices of the Crop and Livestock Reporting Service.

Data for earlier years comparable to these published herein are available in other publications as follows: Data on balance sheet numbers, amount and value of production in mimeographed publications entitled "Farm Production from Meat Animals"; data on income in multilithed publication entitled "Income Parity for Agriculture", Part I, Farm Income, Sections 3, 4 and 6.

FARM PRODUCTION AND INCOME FROM MEAT ANIMALS

EXPLANATORY NOTES

Following is an explanation of the various items included in this report with indications as to the sources of information.

ON HAND JANUARY 1: Inventory numbers at the beginning and end of the year are estimates of the Crop Reporting Board.

ANIMALS BORN: Calves: The number of calves born is computed by multiplying the number of all cows 2 years old and over on farms at the beginning of the year by an estimated percentage of calves born during the year. These estimates are based upon sample data obtained from farmers at the end of the year.

Pigs Saved: The number of sows farrowing in the spring (Dec. 1 to June 1) and fall (June 1 to Dec. 1) is estimated by the Crop Reporting Board and is published in Pig Crop Reports of June and December. These estimates are based primarily upon Census enumerations for census years. The year to year changes are estimated currently from indications of changes in numbers from the June and December Rural Carrier Livestock Surveys and are revised on the basis of assessors' enumerations and marketing records. The "pigs saved" item is computed by multiplying the estimated number of sows by the average number of pigs saved per litter reported on the June and December Rural Carrier Livestock Surveys and is interpreted to mean the number of spring or fall pigs on hand or sold before June 1 or December 1.

Lambs Saved: This term is defined as the number of lambs living June 1 or sold before June 1 for the Native Sheep States and as lambs docked or branded in the Western Sheep States. The estimates of lambs saved per 100 ewes 1 year old and over are based upon indications from the June 1 Rural Carrier Livestock Survey for the Native States and a special survey July 1 in the Western Sheep States. The estimated percentage lamb crop is applied to the estimated number of ewes 1 year old and over on farms January 1.

INSHIPMENTS: This item is based principally upon records showing the shipments into the States, such as the Bureau of Animal Industry records of inspection at public stockyards of feeding, breeding, and dairy cattle, feeding and breeding sheep, and feeding and breeding hogs; railroad records of receipts of livestock; and State Sanitary Board or brand (cattle) inspections. Some reports are received on the direct movement of livestock. Livestock shipped into a State for immediate slaughter is not included in this item.

SHIPPED OUT: The shipments to markets and packers within the State, and shipments out of the State, are based upon reports from the stockyard companies, packers, State Sanitary Boards, and railroad data. In States where such records are incomplete, the shipments are estimated on the basis of sample data. The average weight per head is estimated on the basis of average weights at the principal markets and of federally inspected slaughter.

LOCAL SLAUGHTER: This item covers retail slaughter based upon Census data for the years 1909 and 1929. In a few States where commercial wholesale slaughter is unimportant, the local slaughter figure includes both wholesale and retail slaughter. The estimated local slaughter for a particular State includes only livestock originating in that State.

FARM SLAUGHTER: This item is the estimated slaughter on the farm for home use and for the sale of meat. These estimates are based upon data from the U. S. Census and yearly sample data.

DEATHS: Cattle and Calves: The estimated deaths from all causes are based upon sample data. Losses of cattle are the number of cattle (including calves) on hand at the beginning of the year, which die during the year. The losses of calves is the number which die during the year of birth.

Hogs: The estimated death loss is based upon sample data. This item covers deaths of hogs on hand at the beginning of the year which die during the year and deaths of spring and fall pigs saved.

Sheep and Lambs: Losses of sheep are estimated from sample data and cover deaths of all stock sheep (including lambs) on hand at the beginning of the year which die during the year. The death loss of lambs is estimated from sample data and is calculated on the number of lambs saved or docked and the number of lambs on feed at the beginning of the year.

NET PRODUCTION: Quantity. The quantity of net production for each State is the liveweight actually produced in that State during the year. It is obtained by deducting the weight of animals shipped into each State from the weight of animals sold off of and slaughtered on farms in each State and by adding or subtracting (as the case may be) changes in inventory weights between the beginning and end of the year. The sum of the net production figures for the several States gives a net production total for the United States.

Value. The value of production in each State is the product of the estimated net pounds produced during the year in that State and the weighted yearly average local market price for that State. The sum of these products gives the value of United States production.

INCOME: Cash Income for each State is the total of receipts from sales of live animals by farmers and from sales of meat from animals slaughtered on farms. It does not include receipts from direct sales of livestock among farmers in the same State. No deductions are made for the cost of animals shipped into the State and no allowance is made for changes in inventories.

Value of Home Consumption is the proportion of animals slaughtered by or for farmers used for farm consumption valued at the average local market price.

Gross Income is the sum of cash income and the value of home consumption.

PURCHASES: Under purchases is included the cost of livestock shipped into each State from livestock markets and from outside the State. The weight of such inshipments is evaluated at an estimated cost per pound based largely upon reported market prices of stocker and feeder animals. The cost of purchases by farmers from other farmers within the State is not included.
