## Fresh Peach/Nectarine 2019/20 Highlights

World peach and nectarine production is forecast up 1.9 million metric tons (tons) to a record 22.3 million as orchards in China, the European Union, and the United States rebound from severe weather in the previous year. Imports and exports are projected up on rejuvenated global supplies.

China's production is projected up 1.5 million tons to a record 15.0 million as early-season dry conditions in topproducer Shandong province were countered by good growing conditions in other producing provinces. With record supplies, exports are set to rebound nearly 60 percent to 100,000 tons, driven by higher shipments to Vietnam. A boost in imports to 28,000 tons is also expected, prompted by an increasing demand for Chilean product and elimination on January 1, 2019, of the tariff on Australian imports as part of the bilateral Free Trade Agreement.

China's Recovery Drives Record Global Peach Production

U.S. production is expected to rise nearly 20 percent to 814,000 tons as plenty of chill hours resulted in very good bloom for California freestone peaches and top East Coast producing states. Higher supplies are forecast to lift exports to top markets Canada and Mexico, rising to 75,000 tons. Lower shipments from Chile in early 2019 are expected to ease total imports to 35,000 tons.

EU production is forecast up nearly 260,000 tons to 4.1 million, its third highest level in 9 years, rebounding from the previous year's losses stemming from a wet spring and extended cold temperatures. Planted area is anticipated to remain stable. Improved supplies are expected to raise exports nearly 30 percent to 200,000 tons and reduce imports to 30,000 .

Turkey's production is projected up slightly to 830,000 tons on favorable weather conditions during bloom and harvest. Planting area also is expected to rise again as growers continue to convert orchards to varieties suitable for export markets and the domestic juice industry. Exports are projected to remain steady at 130,000 tons on stable supplies. Note: the historical production series has been revised going back to 2001/02 due to updated data.

Chile's production is estimated at 162,000 tons, a marginal rise on slightly higher yield. Exports are expected to remain steady at 98,000 tons as higher shipments to China offset lower shipments to top market United States.

Japan's production is forecast to slide 12,000 tons to 102,000 . Weather events have exacerbated the overall downward trend as orchards continue to suffer from a 2018 typhoon, followed by frost and hail damage in spring 2019 that further lowered yields.

Australia's production is expected to see a third straight year of improvement, rising to 96,000 tons. This trend is expected to continue growing as orchards are replanted with newer, higheryielding varieties. Parallel to production, exports should see a third straight year of growth, rising to 17,000 tons on higher supplies and strong demand from top-market China.

Russia is expected to remain the world's top importer as sustained shipments from Turkey and Belarus keep imports nearly unchanged at 225,000 tons.

## Data Changes:

- The "For Processing" category for Argentina peaches has been reduced to zero going back to 2001/02 because the quantity of processed peaches is unknown. The balance has been added to the "Fresh Domestic Consumption" category.

World cherry production is forecast to ease slightly to 3.6 million metric tons on weatherdamaged crops in the European Union. Despite record Chilean exports, global trade is expected to slip to 454,000 tons on lower Uzbekistan and U.S. shipments.

Turkey's production is expected to rise over 40,000 tons to 865,000 on good growing conditions. Spurred by strong export demand, growers are continuing to invest and improve orchards, switching to high-yield varieties and gradually expanding acreage for sweet cherries. Modern high-density orchards have also recently been established using new cultivars, rootstocks, training systems, and growing techniques. Higher supplies are expected to raise exports to a near-record 78,000 tons, continuing its long upward trend. Note: the historical production series has been revised going back to 2001/02 due to updated data.

Chile's production is forecast to jump 30,000 tons to 231,000 on increased area of mature bearing trees. Between 2009/10 and 2018/19, growing area has almost tripled, a trend that is expected to continue. Exports are projected up to 205,000 tons on higher supplies, with shipments to China accounting for a vast and increasing share of Chile's total exports. The percent of exports going to China has risen from 13 to almost 90 percent since 2009/10.

China's production is forecast up 24 percent to 420,000 tons as orchards recover from last year's freeze-damaged

China Accounts for Increasing Share of Chile's Cherry Exports
 crops and as more trees come into production. Imports are expected to rise 15,000 tons to 195,000 as higher supplies from Chile more than offset lower shipments from the United States. Though higher tariffs remain in place on U.S. cherries, the United States is expected to remain China's top Northern Hemisphere supplier.
U.S. production is anticipated to remain steady at 450,000 tons as good growing conditions for sweet cherries offsets a biennial off-year decline in cyclical tart cherry production. Imports are expected to rise to 18,000 tons on higher available supplies from Chile. Exports are forecast to decline for the second straight year, down to 80,000 tons, as high retaliatory tariffs continue to suppress U.S. shipments to China. If realized, this will mark the first time U.S. cherry exports have experienced 2 straight years of decline since 2002/03, when output suffered a 44percent drop that significantly lowered
U.S. Cherry Exports to Decline for Second Straight Year

exportable supplies. Despite declining exports, the United States is expected to remain the leading exporter among Northern Hemisphere suppliers. However, given current trends, Turkey could overtake after 2019/20.

EU production is projected to drop over 20 percent to 648,000 tons as hail affected early varieties in Italy, and frost, low temperatures, and drought caused significant loss of fruit buds in top-producer Poland. Lower supplies are expected to pressure exports lower to 15,000 tons and boost imports to 55,000 tons.

Russia's imports are expected to contract 13,000 tons to 80,000 on lower supplies from Kazakhstan, Moldova, and Serbia.

## Data Changes:

- The "For Processing" category for Canada and Ukraine cherries has been reduced to zero going back to 2001/02 because the quantity of processed cherries is unknown. The balance of each is being added to their respective "Fresh Domestic Consumption" categories.

## Marketing Years:

Peaches/Nectarines - Northern Hemisphere countries are on a January-December year.
Southern Hemisphere countries are on a November-October year indicated as the first year of the split year.

Cherries - Northern Hemisphere countries are on an April-March year. Southern Hemisphere countries are on a November-October year indicated as the first year of the split year.

The next publication of this circular will be in September 2020.
