October 10, 1951

## TRUCK CROPS FOR COMMERCIAL PROCESSING GENERAL SUMMARY OF PRELIMINARY ACREAGE, OCTOBER 1 CONDITION AND INDICATED PRODUCTION

The prospective 1951 production of 9 important truck crops for commercial processing is estimated at 6.33 million tons, according to the Bureau of Agricultural Economics. The production of these crops in 1950 amounted to 4.89 million tons and for the preceding 10-year period, it averaged 4.97 million tons. These estimates cover all of the processing truck crops regularly estimated by the Bureau except asparagus, pickling cucumbers, open-market purchases of kraut cabbage and the fall crop of processing spinach.

October 1 reports from tomato canners and products manufacturers indicate a record large crop of tomatoes for 1951. In almost all of the late tomato-producing States, September weather was very favorable for the growth and harvesting of the crop. The indicated production is 3,884,300 tons, 41 percent above last year's production and 35 percent above average.

Sweet corn production prospects declined slightly from the September 1 forecast and 1,197,100 tons is now estimated for canning, freezing and other processing. This compares with 974,200 tons obtained last year and an average of 1,149,700 tons for the 1940-49 period. Delaware, Maryland, Virginia, Iowa, Nebraska, Oregon and Washington are important States showing some reduction in indicated yields after September 1.

Production of green lima beans for processing is placed at 86,490 tons, the second largest crop on record. In 1950, 80,500 tons were harvested and for the preceding 10-year period, it averaged 45,470 tons. On October 1, canning beet production was placed at 164,900 tons which compares with 174,500 tons for 1950 and a 1940-49 average of 129,100 tons. On the basis of October 1 reports from kraut packers, the indicated contract production of cabbage is 107,400 tons, slightly more than was indicated 30 days earlier this season.

A total of 512,510 tons of green peas for processing was harvested in 1951. This compares with 433,830 tons obtained last year and an average of 492,470 tons for the 10-year period. The yield per harvested acre this year is the largest on record.

<sup>3/</sup> For indicated 1951 production of all asparagus (fresh market plus processing) see report TC-51: 602. For indicated 1951 production of all cabbage (fresh market plus kraut) for seasonal groups estimated to date, see report TC-51: 1002.

GREEN LIMA BEANS FOR PROCESSING  
 ACREAGE AND INDICATED PRODUCTION  
 1951, with Comparisons

(Canned and Frozen Green Lima Beans for Commercial Processing)

On October 1 indicated production of green lima beans for canning and freezing was 86,490 tons, the Bureau of Agricultural Economics reported today. This is 7 percent less than the record crop of 1949 but 7 percent more than the 1950 production. Prospects declined slightly during September in New York, New Jersey, Maryland and Washington which more than offset the gains reported for Delaware, Pennsylvania, Ohio, Michigan and Wisconsin.

Prospective yields per acre are above average for all of the principal producing States. However, they are below the 1950 yields in the six Eastern States where there was some complaint of mildew on the acreage remaining for harvest on October 1.

BEEETS FOR CANNING  
 ACREAGE AND INDICATED PRODUCTION  
 1951, with Comparisons

(Truck Crops for Commercial Processing)

The October 1 indicated production of beets for canning is 164,900 tons, according to the Bureau of Agricultural Economics. This compares with 174,500 tons harvested in 1950 and an average of 129,100 tons for the 1940-49 period.

The October 1 indicated yield is 9.16 tons. This compares with 9.14 tons obtained last year and an average of 7.92 tons for the 1940-49 period. Improvement in yield prospects during September in Wisconsin of half a ton per acre more than offset less favorable prospects in New York. However, in all important States, the October 1 indicated yields are above average.

TC-51: 1007 October 10, 1951

CABBAGE FOR KRAUT  
ACREAGE AND INDICATED PRODUCTION  
1951, with Comparisons

(Truck Crops for Commercial Processing)

The October 1 indicated contract production of cabbage for sauerkraut is 107,400 tons, a slight increase over that reported for September 1, the Bureau of Agricultural Economics reported today. The prospective 1951 production is 13 percent less than that harvested in 1950 but 32 percent more than the 10-year average crop. This estimate includes production from acreage grown by kraut packers on their own or leased land as well as production from acreage grown under contract. It does not include open-market purchases of cabbage for kraut manufacture. Information is not available at this time on the probable extent of such purchases from the 1951 crop. An estimate of these purchases will be made next December. In 1950 kraut packers purchased about one-half of their requirements on the open market. For the preceding 10-year period open-market purchases constituted, on the average, about 53 percent of kraut packers' total supplies.

The summer and early fall domestic areas produce most of the cabbage used for kraut manufacture. Total supplies of cabbage in these areas, for both fresh market and kraut manufacture, are expected to total 583,500 tons. This October 1 estimate, which is practically the same as that for September 1, is 17 percent less than the crop grown for harvest in 1950 but is 14 percent more than the 10-year average. However, the prospective 1951 crop in these areas is only about 1 percent less than that harvested in 1950, since 16 percent of last year's production was not harvested. The acreage in these areas that is under contract to kraut packers is expected to produce 98,900 tons compared with 114,800 tons last year. This leaves 484,600 tons available for the fresh market and for open-market purchases by kraut packers. This compares with 586,300 tons available in 1950.

SWEET CORN FOR PROCESSING  
ACREAGE AND INDICATED PRODUCTION  
1951, with Comparisons

(Truck Crops for Commercial Processing)

Sweet corn production prospects declined further during September according to the Bureau of Agricultural Economics, and on October 1 the production was placed at 1,197,100 tons for canning, freezing and other processing. This compares with 974,200 tons estimated for 1950 and an average of 1,149,700 tons for the 1940-49 period.

The October 1 indicated yield is 2.66 tons per acre. This compares with 2.89 tons obtained last year and an average of 2.48 tons for the 1940-49 period. The October 1 indicated yields were lower than on September 1 in Delaware, Maryland, Virginia, Iowa, Nebraska, Oregon and Washington. In most of the other important States from Minnesota eastward to the New England States, the indicated yields on October 1 were equal to or slightly better than on September 1.

GREEN PEAS FOR PROCESSING  
ACREAGE AND INDICATED PRODUCTION  
1951, with Comparisons

A total of 512,510 tons of green peas for processing was harvested in 1951, the Bureau of Agricultural Economics reports. This compares with 433,830 tons obtained in 1950 and an average production of 402,470 tons for the 10-year period.

The revised estimate of acreage planted to green peas for processing in 1951 is 472,000 acres. The preliminary estimate of acreage harvested is 449,710 acres. The difference between the planted and harvested acreage, 22,290 acres or about 5 percent, represents acreage from which no peas were harvested for canning, freezing and other processing, including acreage in the Northwest diverted to dry peas.

The 1951 estimated yield per acre is 2,279 pounds. This compares with 2,075 pounds obtained in 1950 and an average yield of 1,940 pounds for the 1940-49 period. The yield per acre estimated for 1951 is the largest on record.

The estimated 1951 production of green peas for freezing is 109,990 tons. This compares with 97,010 tons for freezing last year and an average of 55,180 tons for the 1940-49 period.

The estimated 1951 production of green peas for canning and other processing is 402,520 tons. In 1950, this estimated production was 336,820 tons and for the 1940-49 period, it averaged 347,290 tons annually.

PIMIENTOS FOR PROCESSING  
ACREAGE AND INDICATED PRODUCTION  
1951, with Comparisons

(Truck Crops for Commercial Processing)

October 1 reports indicate that rains in the main pimiento producing areas of Georgia came too late to help the crop, the Bureau of Agricultural Economics reported today. The indicated 1951 production of 15,300 tons is the same as was estimated a month ago, and is only about one-third as large as the 1950 crop, although 14 percent above the 10-year average crop. The prospective yield per acre is lower than that harvested in any year since 1941. Light harvesting is expected to continue until frost from the plants that survived the drought.

For acreage and yield data on this crop see table on back of report TC-51: 1004.

TOMATOES FOR PROCESSING  
ACREAGE AND INDICATED PRODUCTION  
1951, with Comparisons

(Truck Crops for Commercial Processing)

October 1 reports from tomato canners and products manufacturers indicate a record crop of tomatoes for processing for the nation this year, both from the standpoint of yield per acre and production, the Bureau of Agricultural Economics reported today. In almost all of the late tomato-producing States September weather was very favorable for the growth and harvesting of the crop. Very little disease damage was reported.

The October 1 indicated production of 3,884,300 tons is 5 percent more than the September 1, 1951 indication of 3,685,900 tons, 41 percent more than the 1950 crop of 2,747,400 tons and 35 percent above the average of 2,883,400 tons for the preceding 10 years.

The October 1 indicated yield of 8.36 tons per acre compares with 7.59 tons obtained in 1950 and a 10-year average of 5.89 tons.
