SUMMARY

Sharply reduced supplies and higher prices will curtail soybean use in 1980/81. October 1 prospects indicate a U.S. crop almost one-quarter smaller than last year. Supplies will total 2.12 billion bushels (57.5 million metric tons), about 13 percent below the record 2.44 billion of 1979/80.

Soybean disappearance is expected to total around 1.95 billion bushels, about 200 million above 1980 production. Utilization will be about 6 percent below last season. Soybean carryover on September 1, 1981, will be drawn down to about one month's total requirement, or around 165 million bushels. By contrast, the carryover of old-crop soybeans on September 1 this year was 359 million bushels.

Prices of soybeans (No. 1 yellow, Chicago) advanced from about \$6 per bushel in May and June to over \$8 in mid-October—approximately \$1.70 per bushel above the level of October 1979, when the price trend was downward. The price rally was caused by this summer's hot, dry weather.

Prices are expected to continue strong but volatile, averaging about 35 to 40 percent above the 1979/80 farm price of \$6.25 per bushel. If harvesting is on schedule from October through December, and if there are no weather complications, prices may decline slightly. But after the harvest, the close supply-demand balance is likely to boost prices even higher than the current \$8. Prices in the second half of the season will be influenced mainly by production in South America—now projected at 20 million metric tons, about 1 million above the 1979/80 record high.

As of October 1, the 1980 soybean crop was estimated at 1,757 million bushels, about 23 percent below 1979, with the drop due mainly to reduction of yields. Soybean acreage for harvest is 67.3 million, 5 percent below 1979. The summer drought reduced yield prospects to 26 bushels per acre, down 6.1 bushels from last year's record figure and the lowest yield since 1976.

*The Fats and Oils Situation is published in February, May, July,
and October.*

Because of reduced supplies, higher prices, and a drop in U.S. hog production, demand for soybean meal is likely to decline from last year's record highs. In turn, soybean crushings are projected to drop around 7 percent from the record 1,123 million bushels processed last season. U.S. crushing capacity in 1980/81 is estimated at about 1,425 million bushels, compared with 1,350 million last season. With fewer beans to process, the industry will have excess capacity and relatively low processing margins.

Soybean exports are projected to decline around 5 percent from last season's record 875 million bushels. The major markets for U.S. beans and meal are Western Europe, Japan, Eastern Europe, Mexico, Taiwan, and Korea. China has become a major U.S. customer, taking 0.9 million metric tons last year. While the Chinese soybean crop is believed to be larger this year, significant imports will still be

needed to meet expanding requirements. Current U.S. export projections do not include an estimate for the USSR.

Like U.S. soybean production, cottonseed, peanut, flaxseed, and sunflowerseed outputs are down sharply. Total oilseed production is estimated at 55 million metric tons, more than a fifth below 1979. However, oilseed carryover on September 1 was higher than last year, partly offsetting the reduced crops. With lower supplies, U.S. exports of oilseeds and products are likely to decline somewhat from the 1979/80 record. But sharply higher prices are expected to boost the value of U.S. exports.

U.S. production of fats and oils in 1980/81 is projected to decline to 14.0 million metric tons, down 3.0 million tons or 19 percent from last year. Most of the drop will be in edible vegetable oils. Production of animal fat (butter, lard, and tallow/grease) will be off slightly as lard output declines about a tenth.

FATS AND OILS SITUATION

SITUATION AND OUTLOOK

SOYBEANS

Supply Off 13 Percent; Prices Move Up

Reduced acreage and sharply lower yields have dropped soybean production in 1980. As of October 1, the crop was estimated at 1,757 million bushels, 23 percent below 1979. Even including carryover of 359 million bushels, the total soybean supply for 1980/81 is 2,116 million bushels, about 13 percent below last year's record 2,442 million.

Despite the smaller supplies and high prices, soybean demand is expected to remain strong. Total disappearance probably will drop to around 1.95 billion bushels, 6 percent below last season but about 200 million bushels above 1980 production. Both domestic crushings and exports are expected to decline from the record highs of last season. Carryover stocks next September 1 likely will be drawn down to around 165 million bushels, or about one month's total requirement.

Prices to soybean farmers in 1980/81 probably will average around \$8.60 per bushel, 35 to 40 percent above last year. The Commodity Credit Corporation (CCC) loan rate for 1980 is \$5.02 per bushel, up 52 cents from 1979.

Harvest prices this fall are relatively favorable to producers. At \$7.69 per bushel, farm prices in September were \$1 above a year ago. Prices may decline a little during the heavy harvest period (October-December), but then a post-harvest rise will likely boost them above current levels because of the close balance between supply and demand. Any price rise will also be influenced by the size of the 1981 South American soybean crop (now projected at a record 20 million tons), and the degree to which China and the USSR enter the world market for soybeans and products. Much also depends upon the U.S. farmer's willingness to withhold soybeans from the market. Producers can use CCC loans as financing while awaiting market developments.

Interest rates for farm facility loans made through the USDA are 12-1/2 percent for loans made on or after September 29, down from 13 percent.

Crushings To Drop

Soybean crushings this season are projected at 1,040 million bushels, 7 to 8 percent below the

1979/80 record of 1,123 million. The projection reflects a prospective decline in domestic requirements and in soybean exports. Higher soybean prices in 1980/81, along with fewer U.S. hogs for feeding, are factors holding down crushings.

The projected crushings would utilize only about 70 to 75 percent of U.S. processing capacity—now estimated at 1,425 million bushels. Last season the industry operated at about 83 percent of capacity, slightly above the long-term utilization rate of 80 percent. With slightly more capacity, and fewer beans to crush, relatively small processing margins will likely continue.

Spot (cash) processing margins averaged 41 cents per bushel in 1979/80, up 5 cents from the year before. Margins averaged 78 cents during September-December 1979, then dropped to the season's low of 8 cents in April 1980. The collapse in spot processing margins resulted from the sharp decline in oil and meal prices relative to soybeans.

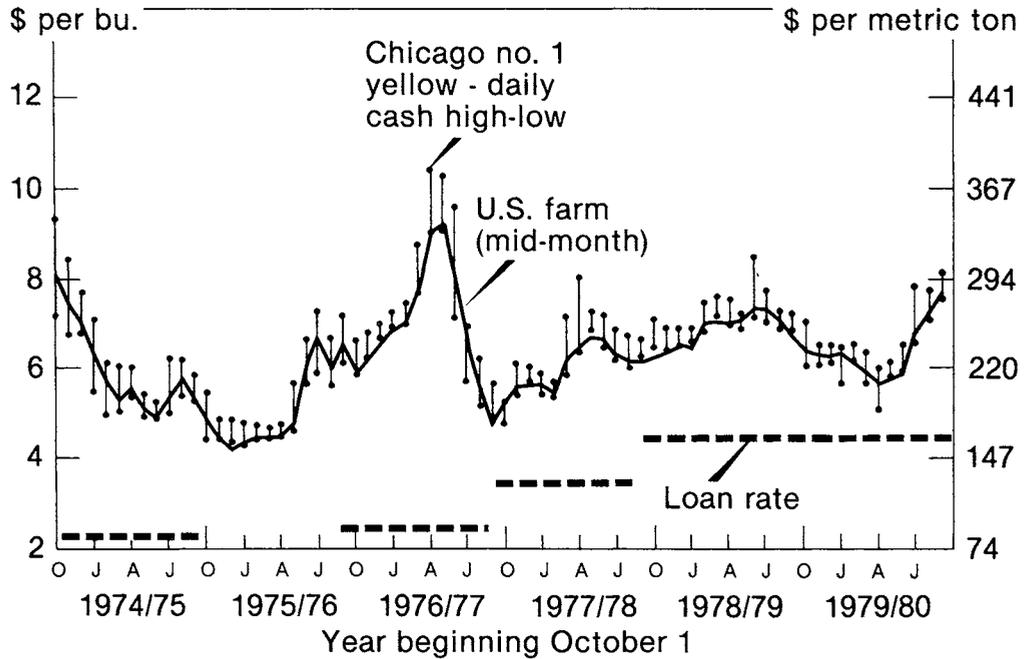

A few years ago, a soybean processing margin of 30 to 40 cents per bushel was considered favorable. But the cost of processing has increased because labor, machinery, storage, transportation, and processing materials (such as hexane solvent) are more expensive. Now a spot margin of 50 to 60 cents is considered favorable.

Exports Also To Drop

Soybean exports in 1980/81 are projected at around 825 million bushels compared with 875 million shipped last season. As with domestic use, exports will be limited by reduced supplies. Also, high U.S. soybean prices, anticipated large South American supplies, and less favorable livestock-feed price ratios probably will reduce U.S. exports by curtailing demand for soybean meal. Nevertheless, so far this season U.S. inspections of soybeans for export are above year-ago levels.

One uncertainty this year is the level of soybean exports to China and the Soviet Union. In 1979/80, U.S. soybean exports to China totaled 810,000 tons (30 million bushels). Our exports this year may be somewhat less because of a larger soybean crop in China, higher U.S. prices, and China's foreign exchange shortage. U.S. soybean and product exports to the USSR have been suspended since January 1980. In 1979/80, U.S. exports to the USSR were

Monthly U.S. Soybean Crushings

USDA

Neg. ESS 17-80 (10)

Monthly U.S. Soybean Exports

USDA

Neg. ESS 18-80 (10)

SOYBEAN MEAL

812,527 tons of soybeans and 24,696 tons of soybean oil. It is believed the USSR also bought an equal amount of soybeans from Argentina. The Soviets' 1980 soybean crop is estimated at around 440,000 tons, about the same as last year but well below earlier years. Also, the crop of sunflower, the major oilseed in the USSR, is about the same as last year's low output. The demand for protein meal is expanding as the Soviets try to upgrade diets with increased livestock and poultry production.

The major markets for U.S. soybeans and meal are Western Europe, Eastern Europe, Japan, Korea, Taiwan, and Mexico.

SOYBEAN OIL

Output To Decline

Because of reduced soybean supplies and smaller crushings, soybean oil production in 1980/81 may total around 11-1/3 billion pounds, some 7 percent below last year's record high. However, carryover stocks on October 1, at an estimated 1.2 billion pounds, were up over 0.4 billion pounds from a year ago. Therefore, total soybean oil supplies, an estimated 12-1/2 billion pounds, are only 3 percent below 1979/80.

Domestic disappearance of soybean oil is projected at around 9.0 billion pounds, a shade above 1979/80. Soybean oil's price advantage is the major reason for increased use, and in 1980/81 supplies of competitive animal fats will be down. Domestic consumption of soybean oil has risen for many years and now accounts for nearly two-thirds of all food fats and oils utilized in the United States, and over 80 percent of the edible vegetable oils. Soybean oil is the major factor contributing to the increased consumption of food fats in the United States.

Soybean oil exports in 1980/81 are projected at around 2-1/2 billion pounds, down somewhat from last season's record-high 2.7 billion. India is the largest single market, taking approximately 40 percent of the total volume of U.S. exports. Other important markets include Pakistan, China, Colombia, Peru and Ecuador.

Soybean oil prices (crude, Decatur) during 1979/80 averaged about 25 cents per pound, compared with 27-1/2 cents a year earlier. Prices in 1980/81 are likely to average higher, possibly in the 25 to 30 cent range. Slightly reduced soybean oil supplies in 1980/81, along with higher prices, will put a damper on export demand. Large soybean oil supplies in Brazil and palm oil from Malaysia will present U.S. soybean oil with more competition this year in a world market where import demand is not expected to strengthen over last season.

Domestic Use To Drop

U.S. soybean meal supplies total an estimated 25 million short tons, about 2 million tons below 1979/80. Domestic disappearance is projected to drop around 1 million tons from last year's record high of 19 million tons—mainly because of sharply higher meal prices and reduced hog output. Cattle on feed may be up slightly in 1980/81, while broiler output may be about the same, but protein feeding rates probably will decline.

Soybean meal exports are projected at around 6.8 million short tons, 13 percent below 1979/80. World demand for protein meals is expected to rise less rapidly than last season. As in past years, Western Europe is expected to take about 55 to 60 percent of total U.S. exports. In 1979/80, for the first time, the USSR had contracted for 0.4 million tons of U.S. soybean meal, but none was shipped because of the January 1980 U.S. suspension of exports to that country.

Reduced supplies of soybeans and meal in 1980/81 are expected to raise meal prices sharply above the \$180 average per ton last season—perhaps around \$70 higher.

South American Soybean Production At New High

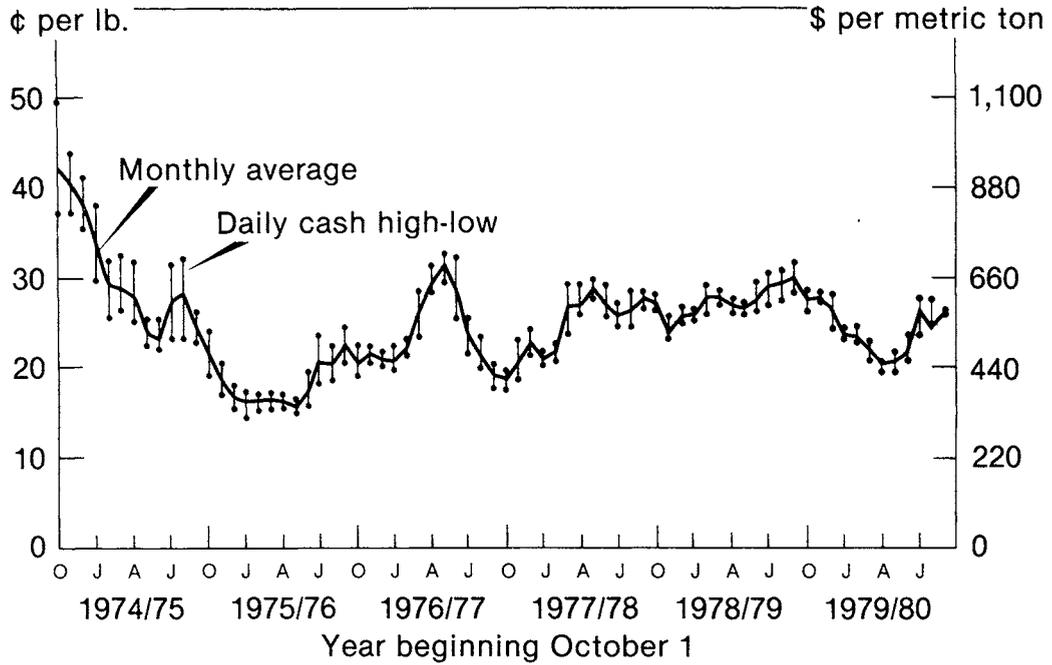

Soybean output in South America is now placed at 19 million metric tons, about 5 million tons or one-third more than in 1979. Virtually all of the increased production is in Brazil.

Brazilian production is forecast at a record 15.0 million tons, up nearly 50 percent from the 10 million tons produced in both 1978 and 1979. About 8.5 million hectares were harvested this year, compared with 8 million in 1979. The yield per hectare was 1.76 tons (26.2 bushels per acre), sharply higher than the poor 1979 yield of 1.27 tons (19 bushels).

Brazilian policy favors crushing soybeans at home and exporting the products—mainly meal. About 12.6 million tons, or 84 percent of this year's crop, is expected to be crushed. Brazil has expanded processing capacity to as much as 19 million tons, according to some trade estimates. Exports of soybeans from Brazil this year are projected at 1.5 million tons, about double the previous year. If about 1 million tons are used for planting seed and waste, the carryover next March 1 will increase to 0.5 million tons, nearly double this year's carryin.

Argentina, the second largest soybean producer in South America, harvested a record 1-3/4 million hectares in 1980, a 9-percent increase over 1979. But because of dry weather, estimated yield per hectare

^{2/} Includes Argentina, Brazil, and Paraguay.
World Crop Production, WCP-10-80.

is down to 1.89 tons (28 bushels per acre), compared with 2.31 tons (34-1/2 bushels) in 1979. Consequently, the 1980 soybean crop is placed at 3.3 million tons, compared with 3.7 million last year.

Argentine soybeans are produced mainly for export. Exports rose from 0.1 million tons in 1975/76 to a projected 3.0 million from April 1980 through March 1981. The USSR will be a major importer of Argentine beans this year—possibly buying around three-fourths a million tons. This total would limit exports available to other countries.

Paraguay is also expanding soybean production to an estimated 700,000 tons in March-February 1980/81, compared with 600,000 tons last year.

South American soybean crops for 1981 will be planted this October through January. Preliminary projections place the harvest next April at just over 20 million tons, some 6 percent above this year's record high—assuming favorable weather.

SUNFLOWERS

Carryover Stocks Up; Production Down

U.S. sunflower supplies are projected at 3 million metric tons, down somewhat from last year. The 1980 sunflower acreage planted in the four survey States (North Dakota, South Dakota, Minnesota, and Texas), at 4.0 million acres, was 28 percent less than last year. Lower prices for sunflowers relative to alternative crops in the Red River Valley lowered 1980 plantings. As of October 1, the 1980 crop yield per acre was 1,130 pounds, compared with 1,349 last year—the drop mainly reflecting the drought. Carryover stocks of sunflowers on September 1 increased to over 1 million tons and partly offset the reduction in the 1980 crop.

Domestic crushings of sunflowers this season are projected at around 0.8 million tons, up sharply from 1979/80. Crush capacity is expanding as consumption of sunflower oil increases.

Sunflower exports in 1980/81 are projected to slightly exceed last season's record high of 1.8 million tons. The European Community is the largest market for U.S. sunflowers, followed by Portugal, South Africa, and Mexico.

Prices received by producers for sunflowers probably will average 35 to 45 percent above the \$195 per ton of 1979/80. Short oilseed crops in the United States along with higher prices for edible vegetable oils and protein meals, will boost prices.

USDA Considering Price Support Program for Sunflowers

The USDA has decided to begin a price support program for sunflowerseed and has asked for public

comments on whether it should be a purchase program or a combination loan and purchase program. The levels of support under consideration are \$6, \$7, and \$8 per cwt. A support program would provide interim financing for U.S. producers of sunflowers. About three-fourths of sunflower production is exported, mainly to Western Europe. Support would be especially helpful from mid-December to April, while the St. Lawrence Seaway, the main U.S. sunflower export route, is closed by ice.

COTTONSEED

1980 Crop Down One-Fifth

As of October 1, the 1980 cottonseed crop is estimated at 4-1/2 million tons, about one-fifth below 1979. Cotton acreage for harvest, at 13.3 million acres, is up 4 percent from 1979, but yields per acre are down sharply because of the dry weather during the growing season.

Carryover stocks of cottonseed on August 1, 1980, totaled 1 million tons, bringing 1980/81 cottonseed supplies to 5-1/2 million tons, down 11 percent from a year ago.

Prices received by farmers for cottonseed during August-September averaged \$113 per ton, slightly below the same 2 months in 1979. Prices probably will rise after the heavy harvest period this fall, as supplies tighten and vegetable oil and protein meal prices strengthen. With protein prices higher relative to cottonseed prices, some cottonseed in the West will be fed to cattle.

Cottonseed crushings are projected at around 4 million tons in 1980/81, near the level of the past two seasons. A crush this size will produce 1.4 billion pounds of oil and about 2.0 million tons of meal.

Cottonseed oil supplies for 1980/81 total an estimated 1.5 billion pounds, about the same as last season. Domestic disappearance may total close to last season's 0.7 billion pounds and exports may also reach 0.7 billion. U.S. supplies of competing vegetable oils—such as soybean, sunflower and peanut—will be less in 1980/81. These edible oils compete as ingredients in the manufacture of shortening, margarine, and cooking and salad oils. In the export market, U.S. cottonseed oil is preferred in Western Europe, South America, and Egypt, and should remain competitive in these areas.

Wholesale prices for cottonseed oil (crude, Mississippi Valley) probably will average between 25 and 30 cents in 1980/81, slightly higher than the 25 cents a year ago, and be competitive with soybean oil.

Cottonseed meal supplies for 1980/81 are placed at around 2 million tons, near last season's level. With continuing strong demand for use in dairy and beef

1/ Preliminary. 2/ Forecast based on October indications. 3/ Includes feed, fertilizer, and loss. 4/ No program. 5/ 41-per-cent, bulk, carlots, Memphis. 6/ Carload lots, Valley. Estimated by ESS. 7/ Crude, F.O.B. Valley. 8/ Average price for all grades and market points, F.O.B. Mills. 9/ Combined value of products per ton crushed. 10/ Spread between combined value of cottonseed products per ton of seed crushed and season average price received by farmers for cottonseed.

cattle rations, domestic use likely will total about 1.8 million tons and exports about 0.2 million. The rising price trend for meat animals will strengthen cottonseed meal prices. During August-September, cottonseed meal prices (41-percent protein, Memphis) averaged \$225 per ton, compared with \$180 the year earlier.

LARD

Output to Turn Down in 1980/81

Commercial lard production in 1980/81 is projected at 1.1 billion pounds, compared with 1.3 billion last year. This downturn is due mainly to reduced hog slaughter and possibly a slight lowering in lard output per hog killed. Output this fall probably will stay near a year earlier, so most of the projected 10 to 15 percent drop will occur in 1981.

Domestic disappearance of lard is projected to drop below 1.0 billion pounds, down from 1.1 billion in 1979/80. Direct use of lard may continue near 0.6 billion, while use in shortening and margarine manufacture shows the sharpest decline. Lard exports and shipments probably will total around 150 million pounds, not much change from recent years. The major overseas markets are the United Kingdom and South America.

Lard prices (loose, tanks, Chicago) probably will average somewhat above last season's 20 cents per pound. Prices in mid-October, at 24 cents per pound, were near a year ago. But when hog slaughter falls behind year-earlier rates, lard prices will pick up. This increase may occur when prices of other edible fats and oils are also strengthening.

PEANUTS

Crop Down Sharply; Smallest Since 1967

U.S. peanut production as of October 1 is forecast at 2.50 billion pounds (farmers' stock basis), 37 percent less than the 3.98 billion pounds produced in 1979. The indicated yield per acre, 1,730 pounds, is 881 pounds below 1979. Peanut acreage for harvest this year is 1.45 million acres, 5 percent below a year ago. Hot, dry weather during the growing season caused the sharp decline in output this year. In the Southwest the peanut crop is down 26 percent, in the Southeast down 43 percent, and in the Virginia-North Carolina area down 29 percent.

Total U.S. peanut supplies are now estimated at around 3.1 billion pounds, compared with 4-1/2 billion pounds in 1979/80. A large quantity of peanuts this year are not making edible grade because of poor quality.

U.S. use of peanuts for food reached a record 2.0 billion pounds in 1979/80, equal to over 9 pounds (farmers' stock basis) per person. Food use in 1980/81 will decline because of the short supply and high prices. Last season, peanuts used in peanut butter and peanut candy showed significant gains over the previous year. Peanut prices were relatively low compared with competitive foods—an important factor boosting consumption.

Peanut crushings in 1980/81 are likely to fall below the 570 million pounds crushed last season. With the sharp drop in the crop, peanut supplies available for crushing will be greatly curtailed. But if peanut quality is poor, more supplies could be channeled into the crushing market. Similarly, peanuts available for export will fall sharply below the 1.0 billion pounds shipped in 1979/80. With the short crop and higher price, U.S. peanuts will not be so competitively priced as last year.

The CCC loan rate for 1980-crop quota peanuts is \$455 per ton, compared with \$420 in 1979. The loan rate for 1980-crop "additional" peanuts is \$250 per ton, down \$50 from the 1979 rate. Prices received by farmers for all grades of peanuts during August-September 1980 averaged 23 cents per pound, compared with 21 cents a year ago. Edible grade peanuts are in short supply this season, leading to expected sharp increases in prices.

Under Section 22 of the Agricultural Adjustment Act, imports of peanuts are limited to 1.7 million pounds (shelled basis) annually. The International Trade Commission has been petitioned to investigate the import quota provisions and has scheduled public hearings in early December.

FLAXSEED

Smallest Crop Since 1976

Flaxseed production is forecast at about 8 million bushels, about 40 percent below last year's 13-1/2 million bushel crop. The sharpest decline occurred in North Dakota, the nation's leading State, where output is off about 52 percent. Production in South Dakota and Minnesota is also down sharply.

Total U.S. flaxseed supplies are estimated at around 15 million bushels, about 3 million bushels below 1979/80. With supply down this much, a reduction in flaxseed crushings from last season's 12-1/2 million bushels is forecast. Flaxseed exports will be nil during 1980/81 with imports of seed from Canada likely to remain 1.9 million bushels. Because of reduced crushings, linseed oil and meal supplies will be down sharply and this will lead to higher product prices—the rise depending partly upon how quickly U.S. industrial activity picks up from the recession.

Flaxseed prices received by farmers averaged \$7

per bushel during June-September, up slightly from 1979. Flaxseed prices are currently at their seasonal low, and some strengthening appears probable over the next few months. Linseed oil prices (raw, Minneapolis) in mid-October were around 30 cents per pound while linseed meal prices (34 percent protein, Minneapolis) are quoted at \$180 per ton.

TALLOW

Output May Dip From 1979/80 Levels

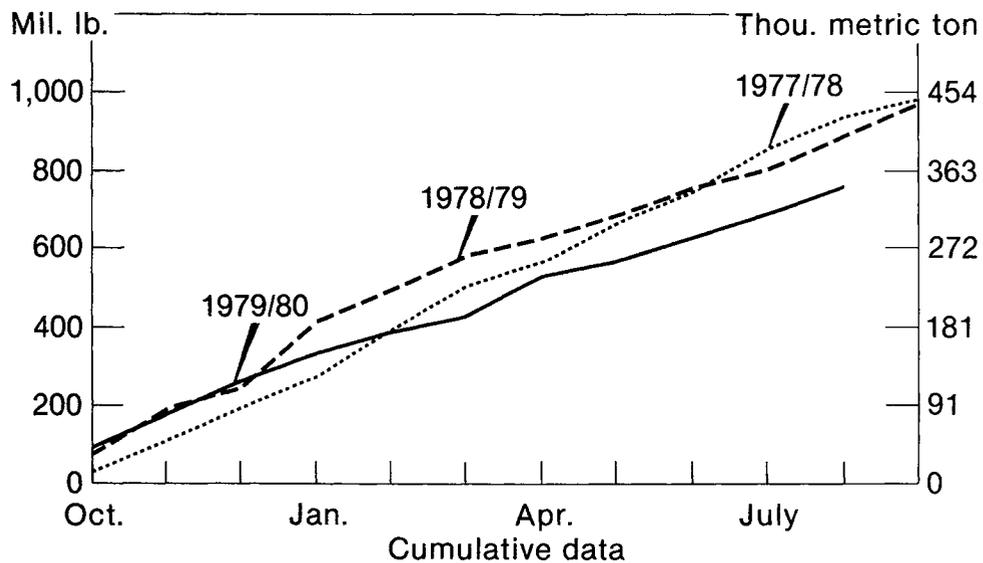

Tallow (edible and inedible) and grease production for 1980/81 is projected to decline slightly from the 7 billion pounds of last year. This drop will result from reduced slaughter of hogs.

Domestic use of tallow/greases in 1980/81 probably will total near 4 billion pounds, about the same as last year, whereas exports may decline slightly from the year earlier 3-billion-pound level. The major domestic market outlets for tallow/greases include shortening manufacture, animal feeds, fatty acids, and soap.

Tallow prices (bleachable fancy, Chicago) probably will average slightly above the 20 cents of 1979/80. Tallow products, such as fatty acids and lubricants, are used in the manufacture of durable goods, and so were hit hard by the 1979/80 recession. But with the economy on the upswing in 1980/81 and industrial activity picking up, tallow prices should rise. Increases in petrochemical feed stock prices may also strengthen the demand for natural fats and oils such as tallow/greases.

WORLD PRODUCTION AND TRADE OF THE MAJOR EDIBLE VEGETABLE OILS DURING THE SEVENTIES

Ed Fryar ¹
Agricultural Economist
National Economics Division, ESS
Crops Branch

ABSTRACT: World production of the major edible vegetable oils increased at an annual rate of 5.6 percent during the 1970's, up from 4.0 percent during the 1960's. This increase was led by soybean oil, palm oil, sunflowerseed oil, rapeseed oil, and coconut oil. There was little change in cottonseed oil, olive oil, and peanut oil. Soybean oil, the most important, accounts for a third of total edible vegetable oil production and about 40 percent of total exports. Total oil production for the 1980/81 crop year should be around 39-40 million metric tons, down slightly from 1979/80. Because of a large carryover, total availability for 1980/81 should be down 3-5 percent from 1979/80.

KEYWORDS: Edible vegetable oils, soybean oil, sunflowerseed oil, palm oil, rapeseed oil, coconut oil, cottonseed oil, peanut oil, olive oil.

The major edible vegetable oils in the order of volume produced in 1979/80, were soybean, sunflower, palm, rapeseed, peanut, cottonseed, coconut, and olive. ² These oils account for over 90 percent of total world production of edible vegetable oils.

Production of the eight major oils in 1969/70 was 22.9 million metric tons compared with 39.3 million tons in 1979/80, a 72 percent increase over the decade. This increase represents a 5.6 percent annual rate of growth compared with a 4.0 percent annual growth rate for the 1960's. The United States alone produces about a fourth of the total world production of edible vegetable oils.

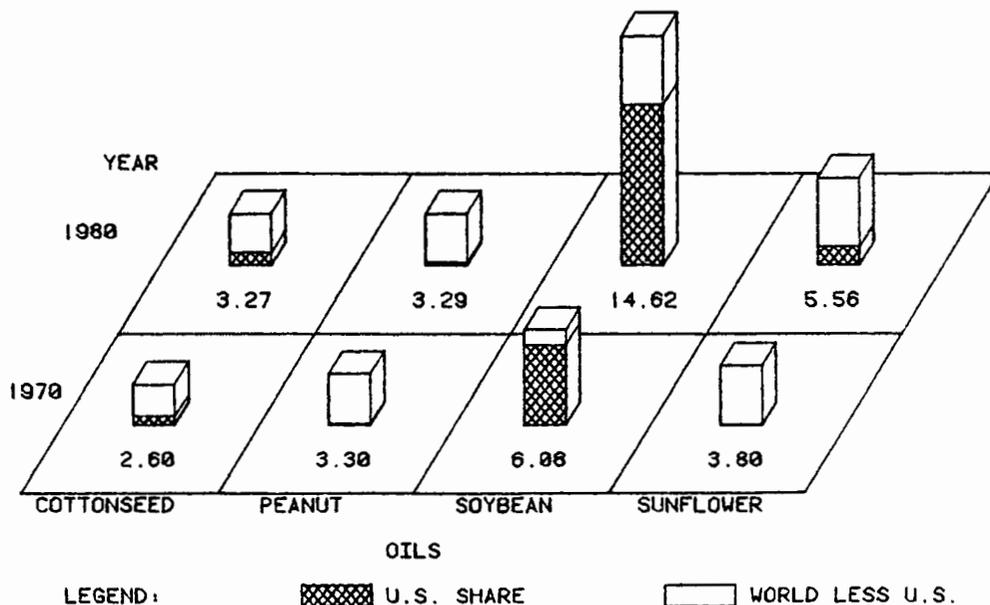

¹ The author is indebted to George Kromer and Harry Doty for comments helpful in the preparation of this paper and to Doug Parry of DSC for help with the graphics.

² All numbers, unless otherwise indicated, are on an oil equivalent basis. Production is calculated using assumed extraction rates. Trade includes the actual oil traded along with the oil equivalent of oilseed traded.

Roughly 40 percent of the total world production of the major edible vegetable oils is exported each year. Of the total world exports, soybean oil accounts for over 40 percent; sunflowerseed oil, palm oil, and coconut oil each account for 10-15 percent; rapeseed oil and peanut oil each account for 5-10 percent; and cottonseed oil and olive oil account for less than 5 percent each. The largest change during the 1970's has been the increase in soybean oil exports from around 30 percent of total exports early in the decade to over 40 percent today. This was primarily the result of increasing demand for high-protein meal for livestock feed in Western Europe and Japan. These areas import oilseeds and process them into oil and meal. As animal numbers have increased in Western Europe and Japan, animal consumption of high-protein meal has also increased thus causing these areas to import more oilseeds, especially soybeans. As soybean imports increase, soybean oil imports (oil equivalent basis) also increase. Thus, the rapid increase in soybean oil trade in the developed countries has been more of a response to an

SELECTED EDIBLE VEGETABLE OILS: WORLD PRODUCTION WITH U.S. SHARE

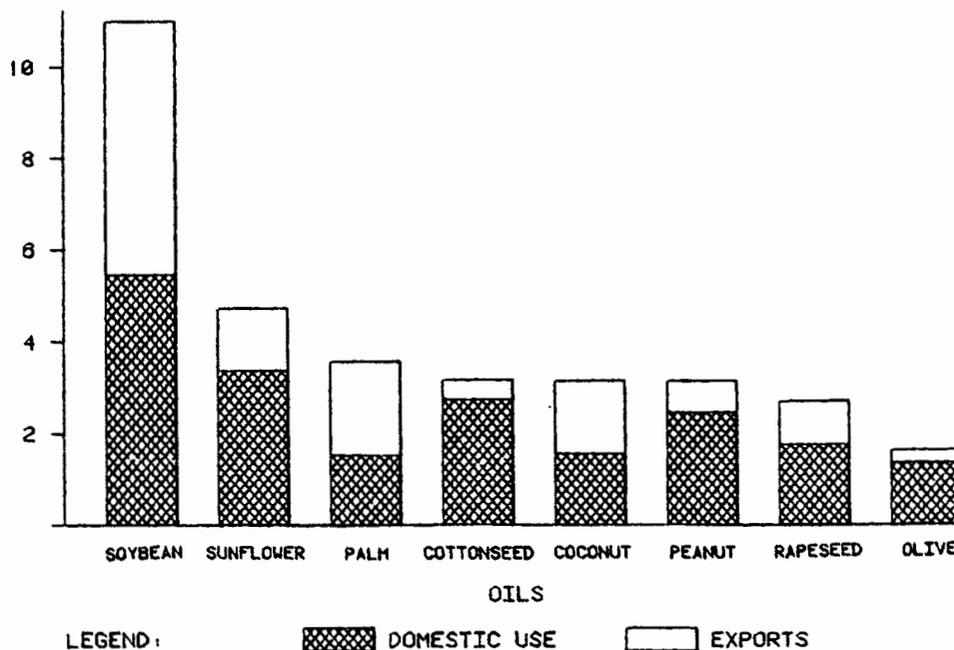

MILLION METRIC TONS

WORLD PRODUCTION EDIBLE VEGETABLE OILS

1978

MILLION METRIC TONS

increased demand for high-protein meal than a response to soybean oil demand. Developing countries tend to import edible vegetable oils primarily as oils and not as oilseeds since they have not invested in the oilseed processing plants necessary to produce oil and meal. By contrast, in the developing countries the driving force is demand for oil for human consumption and not demand for oilseed for crushing purposes.

Soybean Oil

Soybean oil is the world's most important edible vegetable oil since it accounts for about a third of total production. During the 1970's soybean oil production increased at an annual rate of 9.2 percent, up from 6.2 percent during the 1960's. The major producers are the United States with 65 percent, Brazil with 15 percent, China with 10 percent and Argentina with less than 5 percent.

The major exporter of soybean oil (oil equivalent basis) is the United States with about 80 percent of total soybean oil exports. About 75-80 percent of total U.S. exports of soybean oil are exported as soybeans and not as oil. Brazil accounts for around 10 percent of soybean oil exports which are primarily as oil and not as soybeans. Argentina exports a little over 5 percent of total exports which are primarily in the form of soybeans with very little as oil.

Japan and Western Europe dominate soybean oil imports. They import soybean oil primarily as soybeans. Europe consumes a portion of the oil it crushes and then exports the remaining oil—the Netherlands and Spain, for example, are the world's third and fourth largest exporters of soybean oil as oil.

The major importers of U.S. soybean oil in the form of soybeans are the countries of the EEC, Japan, and Spain—the Netherlands and Japan are the two largest importers. The largest importers of U.S. soybean oil as oil have been India, Pakistan, Iran (prior to the revolution), China, and Peru.

Sunflowerseed Oil

The major producer of sunflowerseed oil is the USSR which accounts for a little over a third of total world production—as compared to about a half of the world total in the early 1970's. The United States today produces between 20-25 percent of total production, up from only 2-3 percent at the start of the decade. Other major producers are Argentina with 10 percent, Romania with 6 percent, and Bulgaria with less than 5 percent. Although production grew at an annual rate of about 4 percent over the entire decade, output actually declined from 1970 to 1976. From 1977 to 1980, world production grew at an annual rate of 14 percent, largely because U.S. production increased at an annual rate of 250 percent.

The major exporting country is the United States with around 40 percent of total sunflowerseed oil exports. U.S. exports are primarily (90 percent) in the form of sunflowerseed and not oil. Germany, the Netherlands, and Portugal import around 75 percent of U.S. exports. Argentina has been next with about 20 percent followed by Romania with around 10 percent. Both of these countries export primarily oil and very little sunflowerseed. The major change in this market has been the cessation of Soviet exports (which were primarily as oil) and their replacement by U.S. exports (primarily as sunflowerseed).

Germany imports about a fourth of world imports primarily as sunflowerseeds. France, the second largest importer, imports around 15 percent, primarily as oil. In the past few years, Mexico has also emerged as a major importer. The remaining importers are mainly other countries of Western and Eastern Europe, each which import about 5 percent or less.

Palm Oil

Palm oil production increased at an annual rate of almost 10 percent during the 1970's. This rate was due primarily to Malaysia's increasing production over 400 percent during the decade. Malaysia today accounts for about a half of the world's total palm oil production. Indonesia accounts for around 15 percent, while other producers account for less than 5 percent each. There is no production of palm oil in the United States.

Palm oil is exported as oil and not as the palm fruit since the producing countries crush the palm fruit as soon as it is harvested. Malaysia exports about 90 percent of its production each year, which amounts to about 70 percent of total world exports. Indonesia accounts for 15-20 percent of world exports. All other producers account for less than 5 percent of exports each.

India has been the major importing country with 25-30 percent of total palm oil imports. The United States, United Kingdom, Netherlands, Germany, Japan, and Iraq each account for around 10 percent of total imports. The United States imports over 90 percent of its palm oil from Malaysia.

Cottonseed Oil

Cottonseed oil accounts for around 8 percent of the total production of edible vegetable oils. It is largely a byproduct of cotton production and is not concentrated in any country or region. The major producers are the Soviet Union, the United States, and China with around 15-20 percent each; India with about 10 percent; and Pakistan with around 5 percent. All other producers combined account for around a third of total production, but they account for less than 5 percent each. Production grew at an annual rate of

1/ Oil was produced during last quarter of first year and first three quarters of second year--Oct./Sept. crop year. Includes oil equivalent of oilseed production based upon assumed extraction rates.

2/ Preliminary.

3/ Forecast based on October 1 indications.

SOURCE: Foreign Agriculture Circular: Oilseeds and Products. FAS/USDA, various issues.

2.3 percent during the 1970's, up from only 1 percent during the 1960's.

Usually only 10-15 percent of cottonseed oil is exported with almost all of this being exported as oil and not as cottonseed. The United States is the main exporter of cottonseed oil with around 80 percent of total cottonseed oil exports.

The major importing nations were Egypt, Venezuela, Japan, and Iran (pre-revolution) which, combined, take about 80 percent of U.S. exports. Europe imports very little cottonseed oil.

Peanut Oil

World production of peanut oil remained virtually unchanged during the 1970's—this followed an annual rate of growth of about 2.5 percent during the 1960's. Four countries account for two-thirds of world production: India with 35 percent, China with 15 percent, the United States with 10 percent, and Sudan with 6 percent. Peanut oil accounts for a little under 10 percent of the total production of the major edible vegetable oils. Slightly over 20 percent of this production is exported each year.

Peanut oil exports account for about 5 percent of total edible vegetable oil exports. The major exporters are the United States (30 percent); Argentina (15 percent); and Senegal and Brazil (10 percent each). With the exception of the United States and Sudan, most exports are in the form of oil and not peanuts. U.S. exports are primarily as peanuts, while Sudan's exports are equally divided between the two.

With the exception of Canada and Venezuela, the major importing nations are European. France is the major importer, with about a third of total imports. Germany, Italy, Netherlands, United Kingdom, Canada, and Venezuela each account for between 5 and 10 percent of imports. Canada has been the major importer of U.S. peanuts, primarily as edible peanuts. West European nations have been important importers of U.S. peanuts, taking almost all as edible peanuts. Another major importer from the United States is Venezuela, which imports almost all oil.

Rapeseed Oil

Rapeseed oil production accounts for a little under 10 percent of total world production of the major edible vegetable oils. Production increased at a 6.4 percent annual rate during the 1970's. Largely as a result of new low-erucic acid varieties being developed, production increased at a 14 percent annual rate between 1977 and 1980. The major producing countries are Canada with 33 percent, China with 20 percent, India with 15 percent, and Poland and France with 5 percent.

About a third of rapeseed oil production is exported each year amounting to between 5-10 percent of total edible vegetable oil exports. Canada is the major exporter, with about half of total rapeseed oil exports. These exports are primarily as rapeseed rather than oil. Other major exporters are France with 20 percent, Germany with 10 percent, and Poland with 5 percent. Each of the countries export mostly oil.

The two major importing countries are India and Japan with about 30 percent each. India imports primarily rapeseed oil while Japan imports mainly rapeseed. Another important importer, Algeria (10 percent), imports primarily oil.

Coconut Oil

Coconut oil accounts for slightly less than 10 percent of the total production of major edible vegetable oils. While coconut oil production grew at an annual rate of less than 1 percent during the 1960's, the rate increased to a little more than 4 percent during the 1970's. The major producers are the Philippines with 50 percent of the total, Indonesia with 15-20 percent, and Sri Lanka with 5 percent. There is no copra production in the United States.

Coconut oil exports account for a little over 10 percent of the total world exports of the major edible vegetable oils. About half of the world's production of coconut oil is exported each year. The Philippines alone account for over three-fourths of total exports. Four out of five tons exported from the Philippines are in the form of coconut oil and not copra. Other exporters account for less than 5 percent of the total each.

The United States is the major importer, with about 30 percent of total world imports. U.S. imports now are all coconut oil, and over 90 percent of these imports come from the Philippines. Germany is next with about 15 percent, followed by the Netherlands with about 7 percent. Both of these countries' imports are almost equally divided between oil and copra. Japan's imports account for about 5 percent of the world total and are roughly two-thirds copra and one-third oil.

Olive Oil

In terms of volume of production, olive oil is the least important of the major edible vegetable oils. However, it is an important oil in the Mediterranean Basin countries, largely because of its unique flavor. World production increased little during the 1960's and 1970's. Major producing countries are Italy and Spain each with about 30 percent; Greece with 15

percent; and Turkey and Tunisia with 5-10 percent each.

Olive oil exports account for only 2-3 percent of the total world edible oil exports—about 15 percent of annual olive oil production. The major exporting nations are Spain with 35 percent and Tunisia with 25 percent.

Except for the United States and Brazil, most nations importing olive oil are in the Mediterranean region. The major importing countries are Italy with 35 percent, Libya with 15 percent, the United States with 10-15 percent, France with 10 percent, and Brazil with 5-10 percent. Almost all imports of olive oil are in the form of oil. The United States imports about 90 percent of its olive oil from Spain and Italy.

World Oil Production to Decline In 1980/81

World production of edible vegetable oils for 1980/81 is expected to decline to 39.5 million metric tons—down from the 1979/80 level of 41.3 million metric tons. The decline will be led by soybean oil, which is expected to be off about 12 percent, followed by sunflowerseed oil, which is expected to decline about 8 percent. Cottonseed, peanut, rapeseed, coconut, and olive oils are expected to change little. Palm oil production is expected to increase about 6.5 percent. Including carry-over, total world availability of edible vegetable oils for the 1980/81 crop year should be down 3-5 percent (based on early October indications) from the 1979/80 crop year.

OUTLOOK '81

OUTLOOK '81 SET FOR NOVEMBER 17 - 20

Watch for OUTLOOK '80—your source for the most up-to-date forecasts of what's going to happen to food and agriculture next year. Scheduled to get underway November 17 in Washington, D.C., the 1981 annual Agricultural Outlook Conference will focus on the U.S. agricultural and general economies, world trade, farm and food policy, nutrition, and the outlook for major U.S. commodities. One session will be devoted to OILSEEDS, FATS AND OILS, ON TUESDAY, NOVEMBER 18 AT 11:15 A.M., in the JEFFERSON AUDITORIUM.

For a preliminary program or other information, call (202) 447-3050, or write:

OUTLOOK '81
Room 3510, South Building
U.S. Department of Agriculture
Washington, D.C. 20250

Registered participants at last year's outlook conference will automatically receive a preliminary program and other conference information.
