World Agricultural Production

First and Second Season Corn Production in Brazil

Data Source: IBGE- Instituto Brasileiro de Geografia e Estatística

Brazil Corn: Reduced Area Does not Reduce Output

Brazil's total corn production for 2009/10 is forecast at 53.5 million tons, up 2.5 million or 5 percent from last month and last year. Harvested corn area for 2009/10 is forecast at 13.3 million hectares, unchanged from last month and down 0.8 million from last year. Yield is forecast at a record 4.02 tons per hectare, up 0.40 tons from last year's drought reduced crop in the southern states of Parana and Rio Grande do Sul.

Harvested area and production for the summer-season crop is estimated at 8.16 million hectares and 33.5 million tons, respectively. The top three producing states for summer-season corn are Parana (~6.6 MT), Minas Gerais (~6.3 MT), and Rio Grande do Sul (~5.2 MT). Record yields are expected in both Parana and Minas Gerais. The state's crop estimates agency in Parana,

Approved by the World Agricultural Outlook Board

DERAL, reports the harvest is 74 percent complete and they expect record yields of 7.5 tons per hectare. In Rio Grande do Sul, the state crop estimates agency, EMATER, expects record yields of 4.85 tons per hectare with approximately 53 percent of the main crop harvested.

Harvested area for the second-season crop is forecast at 5.14 million hectares and second-season production at 20 million tons. Nearly three-quarters of the second season crop is grown in the states of Parana and Mato Grosso, where approximately 6 and 8 million tons will be produced respectively. Planting for the second season crop was completed in Mato Grosso on March 10 and planting finished for Parana on March 31. Seasonal rains for the second season crop have been favorable in both states and beneficial rains will be required in Mato Grosso through May and in Parana through June. *(For more information contact Dr. Curt Reynolds at 202-690-0134).*

Mexico's Corn Production Estimated Lower

The 2009/10 Mexican corn production is revised down by 3.2 percent to 21.3 million tons based on official statistics from Mexico's Secretariat of Agriculture, Livestock, Rural Development, Fisheries and Foodstuffs (SAGARPA). Corn area was revised down by nearly 15% to 6.23 million hectares because of high abandonment from the spring/summer crop. During the 2009/10 spring/summer growing season, rainfall across the central corn plateau dropped below normal because of "El Niño" weather patterns. However, yields are up by 3.3 percent from the previous year's crop. Corn yields were 3.42 tons per hectare in 2009/10 which is above the 5-year average of 3.07 tons/hectare but slightly down from the previous month's forecast. Corn yields have greatly improved in recent years because of improved seed varieties, higher sowing densities, and improved agricultural extension support. *(For more information contact Arnella Trent at 202-720-0881).*

El Niño Did not Reduce South Africa's 2009/10 Corn Output

South Africa's 2009/10 corn production is forecast at 14.0 million tons, up 0.5 million tons from last month and up 1.4 million from last year or 10 percent. Corn area is forecast at 3.25 million hectares, unchanged from last month and up 0.35 million from last year. The forecast yield of 4.31 tons per hectare is slightly below last year's record yield of 4.34 tons. Seasonal spring rains arrived on time and were near average during the planting season from October through December, 2009. Rainfall during January was well above-average which was beneficial for crop development during the vegetative to early-grain-filling stages. Rains continued to be favorable during February and March, with the western part of the Maize Triangle receiving above-average rains during March. The moderate El Niño forecast did not bring drought conditions in South Africa's grain basket region as generally expected during El Niño years. In contrast, seasonal rains were above-average, with many fields waterlogged in the Free State province during late February. This is the third consecutive year with excellent yields which is rare for South Africa where seasonal rainfall is highly variable. USDA/FAS personnel traveled within South Africa's Maize Triangle during the third week of February. Crop conditions in the high-yielding eastern part of the country were observed to be excellent and similar to last year's record yields. Crop conditions were observed to be good in the low-yielding western part of the country, but March rains were above-average which should enable crop yields in the west to be similar to last year's record yields. In addition, water balance models and NDVI (Normalized Difference Vegetation

Index) time-series graphs indicate crop yields should be comparable to last year's record yields for most provinces. *(For more information contact Dr. Curt Reynolds at 202-690-0134).*

Turkey's 2009/10 Wheat Crop Estimated Higher

Turkey's 2009/10 wheat production is estimated at 18.0 million tons, up 0.2 million from last month and up 1.2 million or 7 percent from last year. Wheat area is estimated at 7.8 million hectares, down 0.9 million hectares from last month but up 0.1 million or 1 percent from last year. Wheat yield was a record 2.31 tons per hectare. The 2009/10 wheat crop was harvested in July-August 2009, after extremely favorable winter growing conditions. Newly available crop estimates from the government of Turkey and the country's private grain trade indicate crop yields and production were slightly higher than previously expected. Winter rainfall totals were nearly double that of the previous year, with wet conditions boosting crop yield while also contributing to widespread grain quality problems. *(For more information, contact Michael Shean at 202-720-7366).*

Argentina Soybeans: Production Expected to Push Record Level

The USDA forecasts Argentine soybean production for 2009/10 at 54.0 million tons, up 1.0 million tons or 2 percent from last month and up 69 percent from last year's estimated 32.0 million tons. This year's estimated production is up 31 percent from the 5-year average of 41.3 million tons. Area is estimated to reach 18.8 million hectares, the same as last month and up 18 percent from last year when drought cut harvested soybean area. Both production and area are forecast at record high levels. The previous record for soy production in Argentina was during 2006/07 when 48.8 million tons were grown.

Dry weather and only scattered showers have been occurring across much of Argentina where harvest has begun but is less than 10 percent complete as of April 9. Earlier wet conditions had spurred fears of disease problems in soy fields, but farmers quickly sprayed as needed. Northern Argentina may have record yields throughout much of Tucuman, Jujuy, Santiago del Estero and even into Salta as early moisture promoted crop growth and branching and brought about heavy pod loads even on late-planted early maturing varieties. Soybeans, in areas of northern Buenos Aires that early in the season had heavy rains and some replanting within edges of fields, have fared well with yields expected to be limited but better than first projected. Producers in many areas of Cordoba and Entre Rios should reap high yields. *(For more information, contact Dr. Denise McWilliams, at 202-720-0107).*

Record 2009/10 Soybean Crop Expected In Brazil

Brazil's 2009/10 soybean production is estimated at a record 67.5 million tons, up 0.5 million from last month and up 9.7 million or 17 percent from last year. Area is estimated at a record 23.2 million hectares, unchanged from last month and up 1.5 million from last year's harvested area. Yield is estimated at a record 2.91 tons per hectare due to favorable weather within most major soybean regions.

Approximately 73 percent of the total soybean crop has been harvested, ahead of the 5-year average pace of 56 percent. The harvest is complete in the states of Mato Grosso, Mato Grosso do Sul, and Sao Paulo states, and nearly complete in Parana and Goais. Harvest progress in Bahia and Rio Grande do Sul are 35 and 30 percent complete, respectively. Record yields were reported in Parana, the second-largest producing state, and near record yields were reported in Mato Grosso do Sul, Minas Gerais, Sao Paulo, and Santa Catarina. Yields in Mato Grosso, the largest producing state, were less than expected due to planting more short-season varieties with lower yield potential; fertilizers leaching from excessive rains during December and January; localized dryness during November; and rust problems with long-season varieties. March rainfall was below-average in the southern state of Rio Grande do Sul, and 70 percent of the crop is still in pod-filling stages. Over 50 percent of the crop was planted late, or after mid-December, due to excessive rains in November and early December. These late planted soybeans experienced dryness during March, and rainfall was also below average during the first week of April. The dry conditions in Rio Grande do Sul should keep crop output close to 9 million tons, but above last year's severely drought affected crop of nearly 8 million tons. (*For more information contact Dr. Curt Reynolds at 202-690-0134*).

Prospects for Australia's 2009/10 Cotton Declining

Australia's 2009/10 cotton production is forecast at 1.60 million 480-pound bales, down 0.15 million 9 percent from last month, but up 0.10 million or 7 percent from last year. Area harvested is forecast at 200,000 hectares, up 36,000 hectares from last year. The yield is forecast at 1742 kilograms per hectare, down 13 percent from last year.

At the beginning of the cropping season, in November and early December, the majority of the cotton growing regions experienced drier-than-normal conditions, above average temperatures, high evaporation, and relatively high crop-water use. This resulted in area planted being below earlier predictions and below most farmer's planting intentions. In addition, the below-average soil moisture conditions resulted in poor establishment of dryland cotton.

In January and February, most cropping regions experienced favorable weather conditions during advanced flowering and boll-formation stages. Although the rainfall came too late to increase cotton plantings, it was beneficial to dryland cotton yields and ensured adequate irrigation water to finish the irrigated crop. However, excessive rains in late February and March are raising concerns for damage to quality and yield, and disruption to early harvest. Potential damage is feared mostly in Queensland regions of St George, Dirranbandi, Emerald, and Thoedore. The majority of the crop is approaching advanced boll formation and maturity, and in some regions picking operations are about to commence. (*For more information, contact Dr. Dath Mita at 202-720-7339*).

This report uses information from the Foreign Agricultural Service's (FAS) global network of agricultural attachés and counselors, official statistics of foreign governments and other foreign source materials, and the analysis of economic data and satellite imagery. Estimates of foreign area, yield, and production are from the International Production Assessment Division, FAS, and are reviewed by USDA's Inter-Agency Commodity Estimates Committee. Estimates of U.S. area, yield, and production are from USDA's National Agricultural Statistics Service. Numbers within the report may not add to totals because of rounding. This report reflects official USDA estimates released in the World Agricultural Supply and Demand Estimates (WASDE-467) April 9, 2010.

Printed copies are available from the National Technical Information Service. Download an order form at http://www.ntis.gov/products/specialty/usda/fas_a-g.asp, or call NTIS at 1-800-363-2068.

The FAS International Production Assessment Branch prepared this report. The next issue of World Agricultural Production will be released after 9:30 a.m. Eastern Time, May 11, 2010.

Yield is on a rough basis, before the milling process
Production is on a milled basis, after the milling process

World and Selected Countries and Regions

TABLE 18

The table below presents a 28-year record of the differences between the April projection and the final estimate. Using world wheat production as an example, changes between the April projection and the final estimate have averaged 2.0 million tons (0.4 percent) and ranged from -6.8 to 6.5 million tons. The April projection has been below the final 17 times and above the final 11 times.

RELIABILITY OF PRODUCTION PROJECTIONS

1/ The final estimate for 1981/82-2008/09 is defined as the first November estimate following the marketing year.

2/ May not total 28 if projection was the same as the final.

3/ Includes corn, sorghum, barley, oats, rye, millet, and mixed grain.
