World Agricultural Production

Argentina: Timely Rain Improves Conditions for Corn Crop

The USDA forecasts Argentine corn production for 2009/10 at 17.2 million tons, up 2.2 million or 15 percent from last month and up 4.6 million or 37 percent from last year. Area is estimated at 2.15 million hectares, up 0.15 million from last month and down 0.10 million from last year. Yield is forecast at 8.00 tons per hectare, compared to the record high 8.04 tons per hectare in 2006/07 and the five-year average of 6.83 tons per hectare. This yield is up 43 percent from last year, when drought severely damaged the corn crop. This year, timely rains and moderated temperatures have served to improve corn growth and development. Corn that is currently at the pollination stage shows good yield potential. Some corn was planted later due to unfavorable planting conditions at the time, as well as farmers' concerns over controversial corn export taxes. This later-planted corn, as well as Argentina's full-season corn, is at risk of sharper than normal yield declines should unfavorable weather occur during the remainder of the growing season. The diverse planting dates could hamper harvest timeliness due to widely differing stages of crop maturity. *(For more information, contact Denise McWilliams at 202-720-0107.)*

Approved by the World Agricultural Outlook Board

Argentina: Cotton Area Expansion Forecast

The USDA forecasts Argentine cotton area for 2009/10 at 435,000 hectares, up 35,000 or 9 percent or from last month, and up 135,000 or 45 percent from last year. Yield is forecast at 425 kilograms per hectare (kg/ha), down 2 percent from last month and last year. The record yield is 547 kg/ha, achieved in 1987/88. Production is estimated at 0.85 million bales, up 0.05 million or 6 percent from last month but down from the record output of 2.09 million in 1995/96. Frequent rain interrupted planting progress, but farmers extended the sowing campaign and planted area increased despite the delays. The wide range of planting dates, however, will likely complicate harvest due to the widely differing stages of crop maturity. Crop conditions are best in Chaco. In Santiago del Estero, crop damage has occurred due to recent hot, dry weather accompanied by wind following excessive rain from November through early January. (*For more information, contact Denise McWilliams at 202-720-0107.*)

Indonesia: Rice Output Forecast at Record Level

Indonesia's 2009/10 rice production is forecast at a record 38.8 million tons (milled basis), up 5 percent from last month and up 1 percent from last year. Harvested area is estimated at 12.0 million hectares, down 1 percent from last year. Yield is estimated at a record 5.01 tons per hectare. Indonesia grows three seasonal rice crops each year, with marketing year 2009/10 crops stretching from October 2009 through September 2010. Dry conditions in October and November delayed planting in rainfed rice growing areas by 30 to 45 days, but the major irrigated crop regions were planted in a timely fashion. Though first-crop planting operations were delayed, irrigation supplies have been adequate throughout the country, and little to no damage to crop productivity is expected. USDA personnel toured major growing areas in January and reported generally excellent crop conditions. The El Nino weather pattern, which is credited with the earlier drier than normal rainfall conditions in eastern Indonesia, is currently weakening in the eastern and central Pacific Ocean. As the system wanes, rainfall over the bulk of the country is expected to improve. In addition, most major reservoirs in Indonesia are reporting normal water storage levels, providing additional assurance that subsequent seasonal rice crops will have adequate irrigation supplies. Indonesia's farmers have been significantly expanding acreage under a new high-yielding rice variety (Ciherang), which outperforms the dominant variety planted over the past 40 years (IR-64). As a result, it is expected that Indonesia will be able to maintain recent trend growth in rice crop yields at roughly 2 percent per annum or higher. (*For more information, contact Michael Shean at 202-720-7366.*)

Brazil: Soybean Forecast Increased Following Favorable Harvest Reports

Brazil's 2009/10 soybean production is forecast at a record 66.0 million tons, up 1.0 million from last month and up 9.0 million or 16 percent from last year. Area is forecast at a record 23.1 million hectares, unchanged from last month, but up 1.4 million or 6 percent from last year's harvested area. Yield is forecast at a record 2.86 tons per hectare due to favorable weather within most soybean regions. Approximately 5 percent of the national soybean crop has been harvested as of February 1, compared to an average of about 2 percent. The harvest in the state of Mato Grosso is the most advanced with 12 to 13 percent of the crop harvested.

USDA/FAS personnel traveled within Brazil's major soybean regions during January to assess crop conditions. Crop conditions were observed to range from good to excellent due to above-average and well-distributed rainfall within most growing regions. Early harvest reports also indicate excellent yields in the major producing states of Mato Grosso, Mato Grosso do Sul, Parana, and Goais. It was observed that planting was delayed in the state of Rio Grande do Sul by heavy rains during November and early December. Rio Grande do Sul is the last major soybean producing state to plant and harvest soybeans, with February and March rainfall critical for successful crop development. Reported cases of soybean rust have been high this year due to wet weather, but rust appears to be under control because of the utilization of short-season varieties and fungicide applications several times during crop development. Short-season varieties with improved yield potential are becoming more popular because they are less susceptible to rust and can be followed with second-season (*safrinha*) corn or cotton crops. (*For additional information, contact Curt Reynolds at 202-690-0134.*)

This report uses information from the Foreign Agricultural Service's (FAS) global network of agricultural attachés and counselors, official statistics of foreign governments and other foreign source materials, and the analysis of economic data and satellite imagery. Estimates of foreign area, yield, and production are from the International Production Assessment Branch, FAS, and are reviewed by USDA's Inter-Agency Commodity Estimates Committee. Estimates of U.S. area, yield, and production are from USDA's National Agricultural Statistics Service. Numbers within the report may not add to totals because of rounding. This report reflects official USDA estimates released in the World Agricultural Supply and Demand Estimates (WASDE-466), February 9, 2010. The release of this report was delayed until February 12, 2010 due to heavy snows in the Washington, D.C. region, which caused the Federal Government to be closed from February 8 to 11, 2010.

Printed copies are available from the National Technical Information Service. Download an order form at http://www.ntis.gov/products/specialty/usda/fas_a-g.asp, or call NTIS at 1-800-363-2068.

The FAS International Production Assessment Branch prepared this report. The next issue of World Agricultural Production will be released after 9:30 a.m. Eastern Time, March 10, 2010.

World and Selected Countries and Regions

TABLE 18

The table below presents a 28-year record of the differences between the February projection and the final estimate. Using world wheat production as an example, changes between the February projection and the final estimate have averaged 2.3 million tons (0.4 percent) and ranged from -7.3 to 6.8 million tons. The February projection has been below the final 20 times and above the final 8 times.

1/ The final estimate for 1981/82-2008/09 is defined as the first November estimate following the marketing year.

2/ May not total 28 if projection was the same as the final.

3/ Includes corn, sorghum, barley, oats, rye, millet, and mixed grain.
