## LIST OF TABLES

Table 1.—Cotton acreages, by States, 5-year averages, 1943-47, and allotments for 1950

Table 2.—Comparative percentages of cotton acreages and cottonseed production, by years, 1943-50, and 5-year averages, 1943-47

Table 3.—Cottonseed production: Cotton Belt, by regions and subregions, 5-year averages, 1943-47, and computed production from the cotton acreage allotments for 1950

Table 4.—Cottonseed production: Percentage changes per square mile, in the regions and subregions of the Cotton Belt, 5-year averages, 1928-32, 1938-42, and 1943-47, and computed production from the cotton acreage allotments for 1950

LIST OF TABLES--Continued

Table 5.—Cottonseed production: Percentage distribution, in the regions and subregions of the Cotton Belt, 5-year averages, 1928-32, 1938-42, and 1943-47, and computed production from the cotton acreage allotments for 1950

Table 6.—Cottonseed production: Percentage changes per square mile in the 14 cotton-producing regions of the Cotton Belt, by States, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 7.—Cottonseed production: Percentage changes per square mile, in States and State segments of the 14 cotton-producing regions of the Cotton Belt, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 8.—Cottonseed production: Alabama, by regions and farming areas, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 9.—Cottonseed production: Arkansas, by regions and farming areas, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 10.—Cottonseed production: Florida, by regions and farming areas, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 11.—Cottonseed production: Georgia, by regions and farming areas, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 12.—Cottonseed production: Louisiana, by regions and farming areas, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 13.—Cottonseed production: Mississippi, by regions and farming areas, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 14.—Cottonseed production: North Carolina, by regions and farming areas, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 15.—Cottonseed production: Virginia, by regions and farming areas, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 16.—Cottonseed production: Oklahoma, by regions and farming areas, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 17.—Cottonseed production: South Carolina, by regions and farming areas, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 18.—Cottonseed production: Tennessee, by regions and farming areas, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 19.—Cottonseed production: Texas, by regions and farming areas, 5-year averages, 1928-32, 1938-42, and 1943-47

Table 20.—Cottonseed production: Alabama, by regions, farming areas, and counties, 5-year averages, 1928-32, 1938-42, and 1943-47

LIST OF TABLES—Continued

## COTTONSEED-SUPPLY AREAS

By

John M. Brewster, agricultural economist

### INTRODUCTION

In any particular location few factors play a more decisive role than seed supplies in determining the size and type of a given cottonseed-oil mill. Seed supplies also affect the length of operating season.

Marked change in the area seed supply will call for some corresponding change in mill plant and operations. Such local information is essential to a particular mill, and knowledge of the volume, density, and long-term trends of cottonseed supplies, area by area, is even more necessary to it (1) for economic comparisons of various mill plant facilities and operating and managerial practices, and (2) for guidance of adjustments in the number, size, and type of mills in the industry as a whole.

To meet such needs, this bulletin was compiled from cotton-production data collected by the Bureau of Agricultural Economics, and from the 1950 cotton acreage-allotment data of the Production and Marketing Administration. The bulletin gives the average cottonseed production for three periods, 1928-32, 1938-42, and 1943-47. In general, the cottonseed-supply areas used in this bulletin are based on the general cotton-production regions and farming areas used by the Bureau of Agricultural Economics. To render the data convenient for the widest variety of purposes, they are presented in both map and tabular form by various area break-downs.

As a partial means of judging the portent of past trends, a possible future cottonseed supply in terms of the 1950 cotton acreage allotment is computed on the assumption (1) that all production conditions remain the same as the 1943-47 average and (2) that cotton planting will be in line with the 1950 acreage allotments.

In general terms, the bulletin shows that cottonseed production in the United States was downward from 1928-32 through 1938-42 and 1943-47, and sharply upward through 1948 and 1949, as follows:

U. S. cottonseed production

<u>Period:</u>	<u>Tons</u>	<u>Index</u>
1928-32. . . . .	6,359	148
1938-42. . . . .	4,962	116
1943-47. . . . .	4,286	100
1948 . . . . .	5,945	139
1949 . . . . .	6,477	151

This trend will tend to stabilize at about the 1943-47 level only insofar as (1) future cotton acreages are approximately in line with the 1950 allotments and (2) technological practices in cotton production remain substantially similar to those of the 1943-47 period.

MAJOR COTTONSEED-SUPPLY REGIONS, 1943-47

The Cotton Belt, as referred to in this bulletin, comprises 873 counties, which produced from 0.5 to 124.9 tons of cottonseed per square mile in at least one of the periods--1928-32, 1938-42, or 1943-47. These counties fall into six general cotton-producing regions (table 3, figs. 3 and 4), namely, the Delta, Coastal Plains, Eastern Hilly and Piedmont, Central Humid, Central Semi-arid, and West (Irrigated). These regions produced on the average about 4.3 million tons (6.5 tons per square mile) of cottonseed during the 1943-47 period.

The Delta included less than 8 percent (49,805 square miles) of the total Cotton Belt area (664,278 square miles), but it accounted for more than 27 percent of the total cottonseed production in the 1943-47 period, because of its relatively high seed density - 23.7 tons per square mile. The Eastern Hilly and Piedmont region ranked next in seed density, averaging 8.6 tons per square mile.

The West (Irrigated) region showed only 3.4 tons per square mile. The significance of that figure is minimized, however, by the fact that cotton production in that region is concentrated in relatively small sections of each cotton-producing county, whereas the seed density per square mile is based on both the total square miles and the total seed production in each county. In varying degrees this principle applies to some extent in any other area - a fact which the reader should always bear in mind as he interprets this bulletin.

Ranking above the West in seed density are the Central Semi-arid, Central Humid, and Coastal Plains regions, averaging 4.8, 4.2, and 4.5 tons per square mile, respectively (table 3). Although the cotton-producing counties in these regions comprise 61.5 percent

(408,341 square miles) of the total Cotton Belt area, they accounted for only 42.3 percent (1,812,900 tons) of the average cottonseed output in 1943-47, owing to their relatively low seed density.

In terms of the 1950 acreage allotments, some regions may this year produce a substantially larger share of the national cottonseed output than they did during the 1943-47 period. For example, the West (Irrigated) region may have increased its share by more than one-third and the Central Semi-arid region may have increased its share by about one-fifth. On the other hand, the Delta would likely produce about the same proportion in 1950 as in the 1943-47 period. The other three regions would account for a declining share of the total.

#### TRENDS IN COTTONSEED OUTPUT

The Cotton Belt has undergone a sharp and persistent decline in its seed production, the output being nearly a third less on an average in the 1943-47 period than it was in 1928-32. This decline represents more than 2,000,000 tons of cottonseed (table 4).

Decline was common to all cotton-producing regions except the West, which showed a 54-percent increase (112,165 tons) in 1943-47 over the 1928-32 period (Figs. 3 and 4). Production in the Delta remained relatively stable. In other words, the 2-million-ton decline from the 1928-32 to the 1943-47 period was limited almost entirely to the remaining four regions: Central Humid, Eastern Hilly and Piedmont, Coastal Plains, and Central Semi-arid. In each of these four regions the decline in seed density was as follows:

<u>Region:</u>	<u>Decline</u>	
	<u>Tons per sq. mile</u>	<u>Percent</u>
Central Humid. . . . .	5.6	57.4
Eastern Hilly and Pied- mont . . . . .	3.7	30.0
Coastal Plains . . . . .	3.2	41.1
Central Semi-arid. . . . .	3.1	39.3

Although the trend in cottonseed production was downward from 1928-32 to 1943-47, it has moved upward in recent years to about the 1928-32 level (table 4). However, in view of the probable cotton acreage limitations, the question arises as to what is the probable future level of cottonseed production. Although predictions on how acreage limitations may affect such production are highly desirable, they are not possible with any substantial degree

of accuracy, especially on a State or county basis. On a State basis, for example, there is a tendency for both cotton acreage and seed production to vary in the same direction, so that, if there is a marked decrease in acreage, seed production will also decrease in, say, 2 years out of 3 (Fig. 1). But from these similar directions in change, one cannot go on to make any reliable prediction as to how much change in seed production will result from a given amount of change in cotton acreage. The smaller the area under consideration the greater the degree of inaccuracy will tend to be. This can be seen by comparing figures 1 and 2.

For these reasons, this bulletin has limited computation of the effect of the 1950 acreage allotments on cottonseed supplies in the United States as a whole and on the six most general cotton-producing areas in particular. On this basis, the 1950 cottonseed output may be about 5 percent greater than the 1943-47 average. (See tables 2, 3, and 4. The allotment acreages involved in these tables are given in table 1.) This expanded output arises from the fact that the increase in cotton acreage in very recent years, relative to the 1943-47 average, more than offsets the 1950 allotment reductions.

More precisely, for the country as a whole, the 1949 acreage was more than 133 percent of the 1943-47 average and the 1949 cotton-seed production was 146 percent of the 1943-47 seed output (table 2). Hence, despite nearly a 22-percent reduction of the 1949 acreage by the 1950 allotment, the 1950 acreage may still be 4 percent larger than the 1943-47 average. As a consequence, the 1950 seed production may be about 5 percent larger than the 1943-47 average.

But, although the general level of cottonseed production may be higher in 1950 than the 1943-47 average, production likely will remain stable in the Delta, Central Humid, and Coastal Plains regions, rise briskly in the West (Irrigated) and the Central Semi-arid regions, but fall somewhat in the Eastern Hilly and Piedmont region (table 4). For example, the average seed output per square mile in the West was more than 1.5 times as large in 1943-47 as in 1928-32, and its 1950 output is expected to be 2.4 times as great. (See figures 5 and 6.)

#### CHANGE IN REGIONAL DISTRIBUTION OF NATIONAL COTTONSEED OUTPUT

The foregoing trends resulted in some important changes in the regional proportions of the national cottonseed output. For example, while the Delta was producing 2.5 percent less seed per square mile in 1943-47 than during 1928-32 (table 4), it contributed 8.5 percent more to the national total (table 5).

Some regions had sharp declines in seed production, but contributed about the same proportion to the national supply. For

example, the Eastern Hilly and Piedmont region produced almost a third less seed in 1943-47 than in 1928-32 (table 4), but accounted for about the same proportion (22 percent) of the national total (table 5). Only in the Central Humid region did the production decline (more than 57 percent), with the result that the region's contribution to the national total was substantially reduced (more than 10 percent).

#### CHANGES IN COTTONSEED SUPPLIES IN STATE SEGMENTS OF 14 COTTON-PRODUCING REGIONS

The 14 cotton-producing regions often cut across State lines. The question arises as to trends in seed supplies within the State segments of these regions.

Striking differences are frequent. For example, the West (Irrigated) region as a whole increased its seed supply by 54.4 percent (table 4) between 1928-32 and 1943-47 but the Arizona segment showed a 5-percent decline (table 6). The New Mexico segment increased its supply more than 30 percent, Texas by nearly 52 percent, and California by more than 107 percent. (See table 6 and figure 7.)

Seed production in the Delta as a whole remained relatively stable between 1928-32 and 1943-47, but its Missouri and Arkansas segments (representing almost two-fifths of the total Delta region) showed increases ranging from 2.6 to 3.4 tons per square mile, respectively. Kentucky, Louisiana, Tennessee, and Mississippi segments (representing more than 60 percent of the Delta region) showed declines ranging from 1 ton per square mile in Mississippi to 4.3 tons in Louisiana.

Seed production declined in all State segments of the Eastern Hilly and Piedmont region. These declines ranged from 0.8 tons in Tennessee to 2.3 tons per square mile in Virginia.

Only in the South Carolina segment of the Coastal Plains region did production per square mile remain the same from 1928-32 to 1943-47. Declines in the other State segments of this region ranged from 3.4 tons (more than 41 percent) in North Carolina to 4.2 tons (55 percent) in Alabama.

#### CONCLUSIONS

The past 20-year trends in cottonseed production raise important questions for the cottonseed-oil mill industry. To what extent, for example, has mill crushing capacity adjusted itself to a sharply declining seed supply? Since total supplies were approximately one-third less, on an average, in the period of 1943-47 than in the 1928-32 period, only two-thirds as much crushing capacity was needed in the 1943-47 period. The problem becomes much more acute when examined on a local basis. (See figure 8.)

Seed production by the Sandy Lands was more than 70 percent less in 1943-47 than in 1928-32 (table 4), thus indicating that a correspondingly smaller crushing capacity was needed to handle the production in 1943-47. Mills in that region have therefore been faced with an extremely difficult situation. Either they have had to run a shorter season while having to bear about the same overhead expense, or they have had to go much greater distances for their cottonseed, thus increasing their procurement costs. The same problem has been facing mills throughout most of the cotton-producing areas, including the Coastal Plains, Piedmont, Eastern Hilly, Ozark-Ouachita, Texas Grazing, Low Plains, Texas Blacklands, and Cross Timbers areas.

In view of the 1950 acreage allotment, this problem of excess mill crushing capacity resulting from declining seed supplies will not be materially reduced in the visible future.

## APPENDIX

The preceding text has been limited to an analysis of seed-production data for the major cottonseed-supply areas only. Tables 1 and 2 show the data on cotton acreage allotments, by States, and on cotton acreage and cottonseed production, by years, 1943-50. Tables 3 through 6, and figures 1 through 9, show data which provide the basis for the analysis of cottonseed production in the major cotton-producing areas of the Cotton Belt. Similar data are given in tables 7 to 37, inclusive, and in figures 9 to 32, for smaller areas. Thus, the reader may be able to discover and analyze his own local situation.
