The Livestock and Meat Situation will be published in February, May, July, August, October, and December.

## Summary

Red meat and poultry supplies in first quarter 1981 are expected to be about 2 percent above a year ago. Pork supplies will likely be 3 to 5 percent below a year earlier, but well above January-March 1979. Broiler production may increase 1 to 3 percent and beef supplies may be 5 to 7 percent above last year. Increased slaughter of nonfed cattle and the buildup of overfinished, heavy-weight fed steers and heifers have resulted in a backlog of cattle, lower prices, and large discounts on overweight fed beef.

Total meat supplies will begin to decline late in the first quarter and continue to drop in the second quarter. Large feeding losses have forced both cattle feeders and hog producers to cut production. Feedlot placements declined 9 percent in fourth-quarter 1980; the decline will be reflected in reduced spring marketings. When the spring grazing season begins, slaughter of nonfed cattle is expected to also decline. Consequently, beef supplies may be down 5 to 7 percent, and pork supplies 6 to 8 percent from spring 1980. Although broiler production may expand 2 percent, total red meat and poultry supplies may be 3 to 5 percent less than last spring.

Livestock prices are expected to rise during first-half 1981; however, producers are unlikely to cover costs. Choice $900-1,100$ pound fed steers are expected to average about $\$ 63$ to $\$ 65$ per cwt. this winter, with much of
the price gain occurring late in the first quarter. Prices will probably average in the low- $\$ 70$ 's in the spring, assuming a good grazing season. Yearling feeder cattle prices at Kansas City will follow the pattern of fed cattle; prices may only average in the mid- $\$ 70$ 's this winter before increasing to the $\$ 80^{\prime}$ s this spring. Favorable grazing prospects, good spring planting conditions, and declining interest rates all favor higher feeder cattle prices. Hogs prices at the seven major markets are expected to average in the mid- $\$ 40$ 's in first-half 1981. Against a backdrop of declining total meat supplies, increasing pork supplies from the first quarter will hold down market-hog prices this spring.

Retail meat prices this winter are expected to be only slightly above the fourth-quarter 1980 level because of large supplies. This spring, retail beef prices are expected to increase sharply, rising about 10 percent as beef supplies decline. However, pork prices are expected to rise only slightly as supplies increase seasonally.

During 1980, per capita consumption of red meat and poultry was record large, as small declines in broiler and beef consumption were more than offset by increased pork consumption. Prices necessary to move these large meat supplies were in sharp contrast to the higher prices throughout the economy. The retail price index for all meat increased by only 2.9 percent compared with an
8.6-percent increase for all food and a 13.4 percent rise in the overall Consumer Price Index. The beef and veal index increased 5.7 percent, while the pork index declined 3.4 percent. Per capita beef consumption
declined 1.5 pounds from 1979; per capita pork consumption rose by 4 pounds. The poultry price index increased 5.1 percent; however, poultry consumption increased by less then 0.5 pounds.

COMMERCIAL MEAT PRODUCTION AND PRICES

[^0]
# FACTORS AFFECTING THE LIVESTOCK AND MEAT INDUSTRY 

## Mild Recession Expected

A mild recession in the first half of 1981 is expected to reduce interest rates moderately from the record levels of December-January. Volatile interest rates in 1980 proved especially troublesome to livestock producers through both increased costs of production and a reduced willingness to hold inventories. Prime interest rates declined from record levels in late winter, to 11 to 12 percent in early July. However, the rates began to rise sharply in mid-November reaching about 21 percent at the end of the year. Prime interest rates declined to about 19 percent in mid-February. Fluctuations in 1981 interest rates are expected to be mild compared with 1980. Market rates, which are expected to decline to about 15 percent this spring, remain high by historical standards.

A mild first half 1981 recession is expected to mark the third consecutive year of essentially stagnant income levels. Total economic output and disposable income per person, both adjusted for inflation, are expected to decline slightly in the first half of 1981 and recover to just above last year's levels in the first half of the year. Recent revisions in national income statistics indicate larger saving rates in 1980 than previously estimated; however, saving rates are still low. However, despite higher prices, the revisions indicate some room in consumer budgets to maintain food quantity purchases.
Large red meat and poultry supplies combined with a slight decrease in real incomes, from winter quarter 1980 will hold down meat price gains. Nominal incomes are expected to continue increasing at about a 10 percent rate in the second quarter, but real incomes may decline slightly more in the second quarter depending on the lagged changes from high interest rates in late fall and early winter. Nevertheless, real income is not expected to decline by the 9.9 percent annual rate recorded in the spring of 1980 . Reduced total red meat and poultry supplies should give further strength to meat prices this spring in spite of the sluggish economy.

## Feed and Forage Prospects

Season ending feed grain stocks in the fall of 1981, as the new harvest begins, are expected to be 60 percent below 1979/1980 levels and will result in the smallest U.S. carryover since 1975/1976. Domestic feed use this year will be down for all feed grains because of higher grain prices, and declining red meat production. However, corn exports are expected to increase to record levels this year. Feed grain exports for October through December ran ahead of the 1979/1980 record pace.
The 1980/1981 U.S. feed grain production is estimated at over 198 million metric tons. The total supply, includ-
ing carryin stocks, is estimated at 251 million tons, nearly 12 percent below the $1979 / 1980$ supply.
'Feed grain prices for 1980/1981 are expected to average well above last year. The farm price of corn is expected to range between $\$ 3.25$ and $\$ 3.60$ a bushel, up from last year's $\$ 2.52$. Corn prices averaged $\$ 3.15$ in October-December and are expected to increase through next summer as total supplies continue to decline. The sharp 27-percent decline in the grain sorghum crop has resulted in a price increase from $\$ 2.34$ in 1979/1980 to an expected range of $\$ 3.15$ to $\$ 3.45$ in 1980/1981. This has particularly affected the commercial cattle feeding operations located in the High Plains.

The $1980 / 1981$ soybean crop is estimated at $1,817 \mathrm{mil}$ lion bushels, 20 percent below the 1979/1980 crop. However, because of large carryin stocks, the total supply was 11 percent below last year. Soybean meal prices at Decatur are expected to average $\$ 210$ to $\$ 260$ per ton, up from $\$ 181.90$ in 1979/1980.

The mild, dry, winter weather of $1980 / 1981$ has been more favorable for cattlemen and sheep producers than last summer and fall. Record high temperatures last summmer and continued dry weather through early winter resulted in sharply reduced forage supplies and poor fall and winter grazing conditions. Increased hay feeding last summer and fall has been partially offset by reduced winter feeding requirements. In addition, drought damaged grain crops were salvaged as silage and hay during the drought, adding to the total roughage supply. Mild weather and clear fields this winter allowed cattle to continue grazing on pastures and crop residues longer than normal.

Hay stocks on January 1 were estimated at 92 million tons, 15 percent below the record level of last year and the lowest January 1 stocks since the 1976/1977 drought. However, with the reduced level of hay feeding this winter, stocks in most areas should be adequate. Hay prices remain about $\$ 15$ a ton above last year, but prices have shown some weakness as feeding demand declines and spring grazing approaches.

Moisture conditions hold the key for many prices in 1981. Livestock producers will need to keep abreast of weather conditions across the country and planting intentions. Wheat producers have planted 11 percent more acreage for harvest in 1981. However, as of January 1 , the prospective plantings survey in the 16 Southern States indicated producers intended to plant 2 percent less corn and 6 percent less grain sorghum in 1981. Soybean producers plan to increase planted acreage by 1 percent. Hay acreage is expected to increase 4 percent in 1981, as producers attempt to rebuild depleted forage stocks. Survey results of planting intentions for the remaining States will be released on March 19.

## LIVESTOCK AND MEAT SUPPLIES

Expected increases in poultry supplies in 1981 are not likely to offset smaller red meat supplies. Beef production in 1981 will be about even with 1980 levels. Large beef supplies in the first quarter, will give way to greatly reduced second quarter supplies. Pork production is expected to decline about 5 to 7 percent this year. Broiler production is likely to increase 4 percent. In anticipation of higher prices, the greatest increases will probably occur in the second half of the year.
Livestock prices, are expected to increase in the second quarter and continue increasing in the second half of 1981. However, these higher prices are unlikely to offset higher production costs. Livestock and poultry producers have absorbed virtually continuous losses since mid-1979. However, increases in forage and feed supplies, decreases in interest rates, and a stronger economy may reverse this trend.

## CATTLE

,-Characterizing the cattle industry in early 1981 is an expanding cattle inventory, an abundance of excessively finished cattle, large nonfed slaughter, large supplies of competing meats, and consequently, depressed cattle prices. Reduced feed supplies and sharply higher grain prices together with record interest rates continue to increase production costs.

## Cattle Inventory Expands

January 1. 1981 marks the first solid expansion of catthe numbers in this cattle cycle. The inventory of cattle and calves increased 3 percent from the 111.2 million head recorded on January 1, 1980 , going to 115 million head this year. These figures reflect producers response to the record-high cattle prices in the spring of 1979 when most heifer retention and breeding decisions for the 1980 calf crop were made. Furthermore, it reflects the excellent grazing conditions which prevailed in 1979 and through the spring of 1980 . The effects of the $1980-$ 1981 drought, which resulted in increased nonfed slaughter and consequently lowered cattle prices, will be seen in the cattle inventory in the second half of 1981 and in 1982. The rate of inventory increase is expected to slow this year because of last spring's unfavorable cattle prices and poor grazing conditions that extended into this year.
The January 1 beef cow herd expanded from 37.1 million to 39.0 million head this year-a 5 percent increase. Commercial cow slaughter in 1980 was 400,000 head greater than the 5.9 million slaughtered during the very favorable grazing year of 1979. The rate of increase in beef heifer retention for possible herd expansion slowed to 4 percent from the 7 percent recorded a year ago. Nevertheless, the number of beef replacement heifers at the beginning of this year still increased by 250 thousand head over the January 1, 1980 level.

A larger proportion of replacement heifers entered the cow herd during the first half of 1980 than in any year since records began in 1973. About 90 percent of the 5.9 million replacement heifers reported on January 1, 1980, apparently calved and entered the cow herd during the year. The 1980 calf crop increased 6 percent (nearly 2.8 million head) over 1979 , and 3.5 percent over the 1978 calf crop. Calves born in the first half of the year represented 71.5 percent of the calf crop. Much of the 1980 crop was weaned this past fall, further expanding feeder cattle supplies at a time of poor cattle feeding margins and reduced feeder cattle demand. However, the rate of increase in the calf crop is expected to slow in 1981.

Changes in the 1981 cattle inventory will reflect the drastic contrast between 1979 and 1980. The larger meat supplies, drought, high feeding costs and sharply lower feeder cattle prices during 1980 will undoubtedly result in a slower rate of expansion in 1981. Herd expansion is still occurring primarily on farms and ranches attempting to more fully utilize forage resources: however, drought has likely reduced expansion plans on many operations. Continued shifting of land into crop production and high energy costs that result in lower forage carrying capacity will hold down the cattle inventory base.

## Feeder Cattle Supplies Increased

determine how much of this feeder cattle supply enters feedlots and how much is slaughtered as nonfeds.

Although it was the largest nonfed steer and heifer slaughter since 1977 , reduced feedlot placements and the larger 1980 calf crop resulted in a 5 percent increase in the feeder cattle supply outside feedlots on January 1, 1981. The number of calves outside feedlots increased 7 percent, while the yearling supply increased 1 percent. Yearling feeder cattle supplies outside feedlots increased despite a 1 percent decline in the total number of yearlings on farms and ranches. This increase occurred because of a 3 percent decline in the number of cattle on feed weighing 500 pounds and over. Weather, cattle prices, and feeding costs over the next few months will

## 1980 Recap

Average dressed weight set another record in 1980 and together with a slight increase in cattle slaughter resulted in beef production rising above year-earlier levels for the first time since 1976. Beef production increased 1 percent above 1979, yet cattle slaughter increased by only 127,000 head. An averaged commercial dressed weight of 635 pounds in 1980 was 4 pounds above the 1979 record and 7 pounds above the previous record, set in 1973. Slaughter weights were heavy in the first half

${ }^{1}$ Estimated U.S. steers and heifers. ${ }^{2}$ Not including heifers for cow replacement.
of 1980, averaging nearly 643 pounds. These heavier weights reflected a slow fed cattle marketing pace and the very favorable weather conditions which contributed to relatively heavy weights for nonfed slaughter cattle. Weights of federally inspected steer carcasses increased 24 pounds above the first-quarter 1979 weights, and cow weights increased 10 pounds.

Nonfed steer and heifer slaughter in 1980 rose to 2.85 million head, 79 percent over 1979. Fed cattle slaughter declined 6 percent, marking the third consecutive year of decline. Fed cattle slaughter comprised only 71 percent of total commercial slaughter and only 89 percent of steer and heifer slaughter compared with 76 and 94 percent, respectively, in 1979. Cow slaughter increased 400,000 head to 6.3 million head, with slaughter increasing in the second half of the year as forage supplies declined. Calf slaughter declined 235,000 head in 1980.

Record high red meat and poultry supplies, sharply higher feeding costs, record interest rates, and a weakening economy resulted in very erratic cattle prices in 1980. Choice $900 \cdot 1,100$ pound steers at Omaha averaged $\$ 67.04$ per cwt. in 1980 , about $\$ 0.60$ below the 1979 average. Prices ranged from a low of $\$ 63$ in April to a high of $\$ 73$ in August. Choice $600-700$ pound steers at Kansas City averaged $\$ 75.23$ per cwt., compared with $\$ 83.11$ in 1979. These feeder cattle prices ranged from a high of $\$ 83.18$ in February to a low of $\$ 69.18$ in May, after interest rates rose to then record levels in March and fed cattle prices declined in the second quarter because of large meat supplies and a weakening economy.
The summer drought caused record high grain prices and increased nonfed slaughter. New record level interest rates further increased production costs in the fall.

[^1]percent below 1978. Net placements during the fourth quarter were 9 percent below 1979 and 16 percent below 1978. Marketings during the quarter declined by 1 percent despite an increase in the number of cattle in the heavier weight groups on October 1. On January 1, 1981 the number of steers weighing over 1,100 pounds and the number of heifers weighing over 700 pounds were 2 to 4 percent above a year earlier. Favorable weather accompanied by high rates of feedlot gain and a slow marketing pace, continues to force more cattle into these heavier weight groups. Producers indicated they intend to market 6.29 million fed cattle during the first quarter. These marketing levels should be met, and if weather conditions are mild, marketings could be even larger. However, marketings should decline late in the quarter because the number of cattle in all lighter weight groups were below last year's levels.

The new year started off with an excess supply of overfinished cattle, continued large nonfed slaughter, and falling prices in mid-January that occurred after reduced supplies in the marketing channel were rebuilt following the holidays. Choice steer prices at Omaha declined from near $\$ 64$ in early January to below $\$ 60$ as larger supplies of heavy yield grade 5 cattle were forced on the market. Prices of Choice fed steers at Amarillo, where heavy weight cattle were not a problem, declined from $\$ 67$ in early January to the low $\$ 60$ 's in February because the glut of heavy cattle forced the entire market lower. Dressed beef prices on the central markets declined from $\$ 103$ per cwt. in early January to the mid- $\$ 90$ 's in early

[^3] commission fees at a midwest terminal market.

February. The price spread between Choice yield-grade 3 and 4 carcasses widened to a $\$ 16 . \$ 20$ discount on yield grade 4 carcasses. The discount on heavy 900 pound and/or yield grade 5 carcasses was even greater.

Consumers and the retail meat industry have increased their acceptance of lower grade "shorter fed lean beef," if for no other reason than lower prices. Consequently, marketing of these excessively finished cattle becomes more difficult, particularly with continued large nonfed cattle slaughter. Federally inspected dressed steer carcasses averaged $4-5$ pounds heavier in January than a year earlier. When the larger nonfed slaughter and poorer conditions of the cattle slaughtered off pasture are taken into account, these fed steers were considerably heavier than the weights of last winter. Heifer weights are even more excessive, with dressed weights running 10 to 12 pounds over a year ago.

## First Half 1981 Prospects

Weather conditions, particularly from now through the second quarter will be critical to marketing patterns and cattle prices. Favorable weather would provide much needed improvements in grazing conditions which should reduce nonfed slaughter levels, and increase stocker catthe demand. Good weather should also limit grain price increases particularly if crop prospects and planting intentions appear favorable.

## Beef Production to Decrease this Spring

Beef production in January-March 1981 is expected to average 5 to 7 percent larger than in the winter of 1980. Both fed and nonfed slaughter are expected to be greater than last year. Commercial slaughter was over 3 percent above a year ago in January. However, fed cattle marketings from the 7 -major cattle feeding States were 9 percent below last year's levels. Nonfed slaughter remains large. Marketings and market weights likely will be improved by early March. In addition, if weather conditions favor improved grazing prospects, nonfed cattle slaughter should decline as existing forage supplies can be fed if necessary. This will enable producers to carry more cattle into the grazing season with reduced risk of needing the lower forage supply.
Reductions in the number of cattle on feed in the lighter weight categories on Janaury 1 which are normally marketed in the second quarter should result in marketings slightly below the low level of 1980 , when only 5.6 million head were marketed. Net placement in the 7 -major cattle feeding States were 5 percent below a year ago in January. Placements were up sharply in Colorado because of very low placements last year when several packing plants were closed and fed cattle marketings were reduced. Excluding Colorado and Nebraska, where placements also increased, net placement declined 14 percent below January of last year. Additional yearling cattle are available to go on feed, but continued feedlot losses, high feeding costs, and an uncertain economy in the first half make it unlikely that feedlot placements will increase to fill this void. Breaking even in the

second quarter would require cattle prices to average in the upper $\$ 70$ 's.
The reduced fall and winter feedlot placements and improved forage supplies could result in a 5 to 7 percent decline in beef production from year-earlier levels in the second quarter and a sharp 10 to 12 percent decline from the large winter quarter beef production. Pork supplies are expected to increase seasonally this spring, but remain below last year. Poultry supplies are expected to increase, but total red meat and poultry supplies are expected to decline sharply.

## Prices Expected to Increase

Prices of Choice 900-1,100 pound steers at Omaha are expected to average in the low-to mid- $\$ 60$ 's this winter, with prices rising late in the first quarter. Reduced marketing weights and reduced meat production should result in increasing fed beef prices averaging in the mid$\$ 70$ 's during the spring quarter. Second quarter price strength is dependent on feedlot marketings becoming current, reduced nonfed slaughter, somewhat lower interest rates, and no greater than a mild downturn in the economy. Choice $600-700$ pound feeder steers at Kan-
sas City should follow the upward movement of fed cattle prices, however, any increases in input costs will detract from feeder cattle price increases. After nearly a year and half of losses, cattle feeders are in a poor equity position. Yearling feeder cattle prices may average in the mid- $\$ 70$ 's this winter and could advance into the $\$ 80$ 's this spring if grazing conditions improve and the forced marketing of feeder cattle slows.

## Second Half 1981 Prospects

Weather patterns, the economy, and prospects for this year's crops will be factors to watch closely for indications of second-half 1981 cattle price strength. Feeder cattle supplies are adequate to support increased placements next summer and fall. However, cattle feeding profitability, and competition from pork and poultry will largely determine second-half production and feeder cattle placements. Beef production in the second half of 1981 may average slightly below last year's production. A strengthening economy and increased real incomes should keep prices up near late-spring levels, until they decline slightly in the fall.

## HOGS

Hog production has begun to contract after inventories reached record levels in 1979. The U.S. inventory of hogs and pigs totaled 64.5 million head on December 1, 1980, down 4 percent from December of last year, according to USDA's Hogs and Pigs report. The breeding inventory was down 5 percent from a year earlier and the market hog inventory, down 4 percent. The U.S. pig crop for 1980 totaled 101.6 million head, down 1 percent from 1979. The report indicated that producers intend to have 6.78 million sows farrow from December 1980 to May 1981.
reduced 6 percent from a year earlier. These intentions combined with a smaller projected litter size indicate a pig crop of 48.5 million head, down 7 percent from a year ago. The smaller projected litter size reflects the usual litter size rather than last year's exceptionally high litter size.

## June-Novemioer Pig Crop Down 5 Percent

The June-November pig crop was estimated at 49.3 million head, down 5 percent from last year's record crop. The number of sows farrowing was down 6 percent, but the average litter size increased slightly from 7.13 to 7.21 pigs per litter. The June-August pig crop totaled 24.4 million head, down 10 percent from a year earlier. The number of sows farrowing was down 10 percent, and 7.16 pigs per litter were saved compared to 7.15 pigs a year earlier. The September-November pig crop totaled 25.0 million head, down 1 percent from a year earlier. Although producers had earlier indicated a 10 percent reduction in sow farrowings, they actually reduced the number of sows farrowing by only 3 percent. The number of pigs saved per litter was 7.26 in September-November up from 7.12 a year earlier

## Hog Inventory High; Hog Slaughter to Decline

The December 1, 1980 market hog inventory reflecting the June-November pig crop was estimated at 50.4 million head, 4 percent below a year earlier. Hog slaughter for the first half of 1981 will be drawn largely from the December 1 market hog inventory, which suggests a decline of around 6 percent from last year's record level.

${ }^{1}$ Estimated commercial. ${ }^{2}$ December previous year.

December hog slaughter was 8.2 million head, 7 percent above a year earlier. The number of kill days in December 1980 was 23 days compared with 21 days a year earlier. During the first 7 weeks of 1981, federally inspected hog slaughter totaled about the same as last year. The inventory of hogs 180 pounds and over was up 2 percent on December 1, 1980 over December 1, 1979.
Hogs to be slaughtered in the first quarter of 1981 will be drawn largely from the 60-179 pound inventory, which was down 7 percent from a year earlier. Accordingly, combined slaughter for the quarter is expected to total about 23 million head, down 5 percent from a year earlier.
Slaughter in the second quarter is expected to increase from the first quarter, but will decline from a year earlier. Commercial slaughter in the second quarter of 23.4 to 23.8 million head is expected, 5 to 7 percent below a year earlier.
Barrow and gilt prices at 7 markets during the first half of 1981 are expected to average $\$ 43-\$ 46$ per cwt., about 32 percent higher than a year earlier. Firstquarter barrow and gilt prices may average $\$ 43$ - $\$ 45$, up 21 percent from a year ago. During the second quarter, barrow and gilt prices are expected to average $\$ 44-\$ 46$, up from last year's depressed second-quarter average price of $\$ 31$. Barrow and gilt prices may average $\$ 53-\$ 56$ in the second half of 1981.
The December-May pig crop produces the hogs for the second half slaughter. If producers follow December 1 intentions, the December 1980-May 1981 pig crop is expected to be down 7 percent from year a earlier. Subsequently, hog slaughter in second-half 1981 should be down 5-7 percent from 1980 levels. The third-quarter slaughter is expected to fall by about 5 percent from last year, while fourth-quarter slaughter is expected to decline 7 percent. For total 1981, slaughter is expected to range from 89 to 91 million head compared with 96 million head in 1980.

## Number of Hog Enterprises Increased, Average Inventory Down

During 1980, there were 674,800 hog enterprises, 3 percent over a year earlier. The average inventory of hogs per enterprise was 96 head down from 106 last year.

Operations with 1.99 head accounted for 77 percent of all operations, but comprised for only 16 percent of the inventory. Enterprises with 500 head and over accounted for 4 percent of the operations and 42 percent of the inventory. The medium-sized enterprises, 100-499 head, accounted for 18 percent of the operations and 42 percent of the inventory.

## Decline in Most Major Production States, But Three Major States Expand

Although the number of hogs in 14 major hog. producing States declined 4 percent. 3 major producing States expanded hog numbers. Producers in Minnesota, Texas, and Ohio expanded their hog inventories 4, 2, and 1 percent, respectively. Iowa producers cut inventories only 1 percent; however. Kentucky reduced inventories
by 17 percent and Missouri producers cut inventories 14 percent from last year. Producers in the other major producing states reduced inventories 6 percent.

## Returns to Hog Producers Decreased in 1980

Preliminary ESS cost of production estimates indicated that net returns to farrow-to-finish producers and feeder pig producers fell sharply in 1980 . Gross returns to farrow-to-finish producers (who supply approximately 75 percent of the hogs for slaughter) fell to about $\$ 40$ per cwt. of hogs sold in 1980, from $\$ 43$ in 1979. Cash costs were estimated to be $\$ 41$ per cwt. sold in 1980. up from $\$ 37$ in 1979. As a result, producers failed to cover direct cash costs. In 1979, producers had a net return of about $\$ 5$ to cover noncash items, such as family labor, management, taxes, and ownership. Nearly half of the increase in direct cash costs in 1980 was in items other than feed.

[^5]Returns to feeder pig finishers were greater in 1980 than in 1979. Gross returns of $\$ 43$ per cwt. of sales nearly covered the direct cash costs of $\$ 44$ in 1980 . In 1979, returns of $\$ 47$ per cwt. sold did not cover the producers'

Returns to producers of feeder pigs declined sharply in 1980 and, returns of $\$ 57$ per cwt. fell short of covering producers' costs of $\$ 66$. In 1979, these producers received $\$ 6$ per cwt. sold over cash costs to cover noncash items; the returns in 1979 were $\$ 66$ per cwt. sold, and direct cash costs were $\$ 60$.

## SHEEP AND LAMBS

The sheep and lamb inventory on January 1, 1981 totaled 12.9 million head, up 2 percent from last year. This marked the second consecutive increase and was only the second increase in sheep numbers since 1960. The inventory included 11.3 million stock sheep, up 2 percent from January 1, 1980. One year and older breeding ewes numbered 8.8 million head, up 3 percent from last year; and ewe lamb numbers were up 1 percent.

The 1980 lamb crop of 8.25 million head was 3 percent more than the 1979 crop. The 1980 lambing rate was 97

1Selling price required to cover costs of feeding 40-50 lb. feeder pig to 220 lb . slaughter hog in Corn Belt.
lambs per 100 ewes that were one year and older compared with a 95 rate in 1979 and 92 rate in 1978. The lambing rate reflected the favorable 1979 through spring 1980 grazing conditions.
The apparent turn around in sheep and lamb production over the past two years was due to higher returns per ewe. Cost of production studies show positive returns over direct cash costs for the past two years. Returns were above direct cash costs in 1979 and in 1980. Projections of costs and returns indicate an expected postive return per breeding ewe over cash costs in 1981, giving limited incentive for expanding production this year. This return above cash cost is not sufficient to cover

replacement cost of all depreciable assets plus land purchase cost. Therefore, most of the expansion will be by existing producers-not new entrants. In fact, the number of sheep enterprises declined slightly ( 0.5 percent) from January 1, 1980 to January 1, 1981. Lamb prices received by farmers averaged in the low and middle $\$ 60$ s the past three years compared with the low $\$ 50$ 's in 1977. Lamb prices averaged $\$ 63.50$ in 1980 , down $\$ 3.20$ from 1979.

Sheep producers also receive incentive payments for wool production. These payments are based on both the support price for wool and the average market price received by producers. The support price was 72 cents from 1970 to 1976. Then the support price was increased to 99 cents in 1977, 108 cents in 1978 , and 115 cents in 1979. In 1980, the support price was 123 cents per pound.

The support price is 135 cents per pound in 1981.
The higher lamb and wool prices which have boosted returns over cash costs in recent years, have encouraged producers to increase their flock and hold more lambs for replacements and expansion. Over the past three years commercial slaughter as a percent of January 1 inventory has been running below the long-term 1961-1977 average rate of 50 percent or more. In 1980 , commercial slaughter was 43.9 percent of the January 1 inventory compared with 40.6 percent in 1979 -the lowest in the last 20 years.

Commercial slaughter was 5,574 thousand head in 1980, up 11 percent from 1979 as drought forced producers to withdraw expansion plans. Slightly lower dressed weights reduced commercial production to a 9 percent gain or a total of 310 million pounds.

## Sheep and Lambs on Feed Unchanged

There were 1.62 million sheep and lambs on feed for slaughter markets in 24 States on January 1, 1981. This number remains unchanged from last year. Sheep and lambs that weighed 100 pounds and over and were on feed in seven states on January 1, 1981 were up 1 percent over a year ago, while those weighing $90-99$ pounds were down 10 percent. However, the number of sheep and lambs in the $80-89$ pound category increased 24 percent. Marketings in the early winter quarter came mainly from the lambs and sheep weighing 90 pounds or more. The number on feed in this weight group was down 5 percent from a year earlier.
During December 1980, commercial slaughter of sheep under federal inspection was up 20 percent from a year ago. Commercial slaughter during the spring quarter is drawn largely from new crop lambs (lambs born after September 30 of the previous year that are on hand January 1). The number of new crop lambs on January 1,1981 was down 1 percent from last year. This spring-quarter slaughter is expected to be near last year's levels.

## Lamb Prices to Strengthen

Slaughter lamb prices at San Angelo averaged $\$ 57.50$ per cwt. in January, down from $\$ 67.40$ a year earlier. Lamb prices began to decrease substantially in October, going from $\$ 66.19$ to $\$ 57.50$ in January. Many important lamb marketing areas reported excessively heavy and/or overfinished lambs, and a large number of lambs being heavy marketed; marketings in seven States for November 1 to December 31 were up 25 percent. Slug. gish demand for beef and pork also contributed to the poor lamb market.
Slaughter lamb prices are expected to increase in the spring and to average in the mid- $\$ 60$ 's for the year.

March-May prices are usually about 10 percent higher than January-February levels. If the seasonal increase occurs this year, prices may average in the mid- $\$ 60$ 's for the spring.

## MEAT CONSUMPTION AND PRICES

Total red meat and poultry consumption (on a retail weight basis) was a record high 212 pounds per capita in 1980. Sharp increases in pork consumption and a slight increase in poultry consumption more than offset a decline in beef and veal consumption. Despite a slight increase in production, per capita beef consumption fell because of lower beef imports and a larger population.

Real incomes declined slightly in 1980 in spite of a 9.9 percent increase in nominal incomes. The retail price index for all meats increased 2.9 percent, while the index for all foods increased 8.6 percent. The retail price index for pork fell by 3.4 percent, while the retail index for beef climbed 5.7 percent. In 1980, per capita beef supplies decreased by 1.5 pounds, but per capita pork supplies increased by 4 pounds. The poultry price index increased 5.1 percent; however, poultry consumption increased by less than 0.5 pounds.

Total red meat and poultry supplies in the first quarter of 1981 are expected to approximate last year's levels of 52.4 pounds per capita. Increases in beef and poultry supplies will more than offset decreasing pork supplies. In the second quarter, a sharp decline in beef production from last year and the first quarter of this year and lower pork production from a year earlier will more than offset increasing poultry production.

Choice retail beef prices averaged $\$ 2.38$ per pound in 1980, increasing 5.7 percent over 1979. Retail pork prices declined 3.4 percent as supplies reached record levels. Retail beef and pork prices are expected to increase only slightly from fourth quarter 1980 levels of $\$ 2.42$ and $\$ 1.55$ per pound for beef and pork, respectively. Beef prices should begin to increase late this winter as beef supplies begin to decrease. Beef prices are expected to rise sharply this spring, as supplies decline-comparable to the price runup in the first half of 1979. Pork supplies are expected to decrease in mid-winter, but supplies will increase seasonally this spring, although they will remain below last year's levels. This will hold down retail price gains for pork as total meat supplies decrease. Choice beef prices at retail are expected to average about $\$ 2.45$ this winter before rising into the $\$ 2.60$ 's this spring. Retail pork prices are expected to average about $\$ 1.55$ through spring.

## LIVESTOCK COST OF PRODUCTION STUDIES AVAILABLE

Additional information on the cost of producing fed cattle, feeder cattle hogs, and sheep is available in a U.S. Senate Print entitled "Cost of Producing Livestock in the United States - Final 1979, Preliminary 1980 and with

Projections for 1981," $72-550-0$. The costs presented in the print update the various Cost of Production budgets. Copies of the Cost of Production Studies can be obtained
by writing to: ESS Information, Room 0054-South, U.S. Department of Agriculture, Washington, D.C. 20250.
