HIGHLIGHTS

July 26 – August 1, 2020

Highlights provided by USDA/WAOB

he remnants of Hurricane Hanna produced early-week downpours in **southern Texas**. Subsequently, the focus for heavy showers shifted northward, primarily in the vicinity of a cold front stretching from the **central Plains into the mid-Atlantic**. South of that cold front, warm, humid weather contributed to scattered rain and a rapid pace of crop development. Some heavier showers fell along and near the **Gulf Coast**. As the week progressed, cooler air trailing the front overspread the **Plains** and **Midwest**. In fact, weekly temperatures averaged as much

as 5°F below normal in Kansas and Oklahoma. Upper Midwestern temperatures remained below throughout the week, allowing corn and soybeans to develop without experiencing heat stress. North of the front, precipitation from the northern Plains into the Northeast was mostly light. Still, enough rain fell in the eastern Corn Belt to ease drought concerns. However, a notable pocket of drought persisted from northeastern Nebraska into central Iowa. Elsewhere, shower activity related to the Southwestern monsoon diminished early in the week, allowing temperatures to soar. In fact, hot, dry weather dominated the West for much of the week, favoring small grain harvesting but reducing soil moisture and increasing stress rangeland and pastures. Temperatures ranged from 5 to 10°F above normal in parts of Washington and Oregon. Readings also averaged at least 5°F above normal in many locations from the middle Atlantic States into New England.

Early in the week, triple-digit heat spread as far north as the mid-Atlantic and Pacific Northwest. On July 26, daily-record highs soared to 100°F in Portland, OR, and Vancouver, WA. It was Portland's hottest day since July 15, 2018, when it was also 100°F. The following day, Williamsport, PA, collected a daily-record high (100°F) for July 27. Williamsport had not attained a triple-digit reading since July 22, 2011, when the high reached 103°F. By July 28, Eastern daily-record highs included 102°F in Norfolk, VA, and 100°F in Providence, RI. Like Williamsport, Providence had last noted a triple-digit reading on July 22, 2011. Meanwhile, Norfolk set a monthly record with 5 days of triple-digit heat during July; the previous mark had been 3 days in July 2019 and several earlier months. In addition, Norfolk tied a 1952 annual record with 5 days of 100-degree heat. Mid-Atlantic locations such as Roanoke, VA, and Washington, DC, set records for the greatest number of 90-degree days in a month—30 days in Roanoke (previously, 26 days in July 1930) and 28 days in Washington (previously, 25 days in July 2011). The late-month heat wave capped the hottest month on record in many Eastern locations, including Miami, FL (average temperature of 85.9°F); Harrisburg, PA (82.2°F); and Clarksburg, WV (78.7°F). Clarksburg's former record of 77.6°F had stood since 1934. Monthly heat records in New York cities such as Buffalo (77.6°F), Syracuse (77.1°F), and Watertown (74.4°F) had survived since July 1921 or 1955. Record-setting July heat extended to other parts of the country, including the Southwest. For example, July 2020 was the hottest month on record in Phoenix, AZ (98.9°F); Del Rio, TX (92.0°F); Tucson, AZ (91.5°F); and Roswell, NM (87.6°F). Phoenix also closed the month with a trio of daily-record highs (115, 118, and 116°F) from July 29-31. In southern California, daily-record highs on the last day of July surged to 125°F in Death Valley; 122°F in Palm Springs; 121°F in Needles; and 120°F in Thermal. Extreme heat extended into the Northwest, where Richland, WA, registered 113°F on July 30—tying an all-time record first achieved on August 5, 1961. Pocatello, ID (104°F on July 31), tied a station record previously achieved on August 2, 1969; August 8, 1990; and July 22, 2000. In Utah, Salt Lake City tallied a trio of dailyrecord highs (104, 105, and 105°F) from July 31 – August 2.

July 25-26 rainfall totals in southern Texas associated with Hurricane Hanna included 8.30 inches in McAllen and 4.32 inches in Brownsville. The 4.52-inch total in McAllen on the 26th was a record for any July day; the previous record of 4.25 inches had been set on July 20, 2005. Selected peak wind gusts from Hanna reached 63 mph in Harlingen and 59 mph in McAllen. Farther north, the week began with heavy rain falling in portions of the Great Lakes States. July 25-26 rainfall in Mankato, MN, totaled 5.57 inches, while daily-record totals for the 26th in Michigan reached 3.59 inches in Alpena and 2.44 inches in Sault Sainte Marie. As the week progressed, the heaviest showers shifted to the Gulf Coast region and an area stretching from the central Plains into the lower Midwest. Daily-record rainfall totals topped 2 inches in locations such as Fort Wayne, IN (2.24 inches on July 27); Saint Louis, MO (2.34 inches on July 30); Topeka, KS (2.53 inches on July 29); New Iberia, LA (2.84 inches on July 28); and Jackson, MS (3.48 inches on August 1). A few heavy showers also peppered the southern Atlantic States, leading to daily-record amounts in Columbia, SC (3.83 inches on July 29), and New Bern, NC (3.04 inches on August 1).

In Alaska, near-normal temperatures accompanied generally light precipitation. However, a late-month surge of warmth across southeastern Alaska resulted in several record highs. On July 30-31, Yakutat posted consecutive daily-record highs (76 and 80°F, respectively). Meanwhile, Sitka reached 88°F on July 31, tying an alltime high originally set on July 30, 1976. Locally significant rain developed across interior Alaska, where King Salmon netted a dailyrecord total of 0.84 inch on July 31. Farther south, Hawaii dodged Hurricane Douglas as the week began. On the afternoon of July 26 and early the following day, the core of Douglas—bearing sustained winds of 85 to 90 mph—passed just north of Maui, Molokai, Oahu, and Kauai. A northerly wind gust to 39 mph was clocked at the Molokai Airport on July 26, followed by a daily-record rainfall of 0.59 inch in Lihue, Kauai, on July 27. Meanwhile on the Big Island, Hilo ended the month on a drier-than-normal note, with a final July total of 5.27 inches (49 percent of normal).

National Agricultural Summary

July 27 - August 2, 2020

Weekly National Agricultural Summary provided by USDA/NASS

HIGHLIGHTS

Warmer-than-normal weather prevailed across most of the eastern and western sections of the country. Most of the mid-Atlantic and Northeast saw temperatures 3°F or more above normal. Most of the Pacific Northwest and large parts of the northern Rockies and the Southwest also saw temperatures 3°F or more above normal. Pockets in Idaho, Oregon, and Washington recorded temperatures as much as 9°F above normal. In contrast, the central section of the nation noted below-normal

temperatures. Much of the Great Plains recorded temperatures 3°F or more below normal. Parts of central Kansas were 6°F or more below normal. Much of the West remained dry during the week. However, higher-than-normal amounts of rain were recorded in large parts of the Great Plains, the western Gulf Coast, the Mississippi Valley, and the Ohio Valley. Parts of Illinois, Indiana, Kansas, Louisiana, Missouri, Oklahoma, and Texas received 4 or more inches of rain for the week.

Corn: By August 2, ninety-two percent of the nation's corn acreage had reached the silking stage, 20 percentage points ahead of last year and 5 points ahead of the 5-year average. By August 2, thirty-nine percent of the corn acreage was at or beyond the dough stage, 19 percentage points ahead of last year and 6 points ahead of average. As of August 2, seventy-two percent of the nation's corn was rated in good to excellent condition, unchanged from the previous week but 15 percentage points above the same time last year. In Iowa, 73 percent of the 2020 corn acreage was rated in good to excellent condition on August 2.

Soybean: By August 2, eighty-five percent of the nation's soybean acreage had reached the blooming stage, 17 percentage points ahead of last year and 3 points ahead of the 5-year average. Nationally, 59 percent of the nation's soybean acreage had begun setting pods, 27 percentage points ahead of last year and 5 points ahead of average. On August 2, seventy-three percent of the nation's soybeans were rated in good to excellent condition, 1 percentage point above the previous week and 19 points above the same time last year.

Winter Wheat: Eighty-five percent of the 2020 winter wheat acreage had been harvested by August 2, five percentage points ahead of last year but 3 points behind the 5-year average. Winter wheat harvest advanced 10 percentage points or more from the previous week in Michigan, Montana, Oregon, South Dakota, and Washington.

Cotton: Ninety-one percent of the nation's cotton acreage had reached the squaring stage by August 2, one percentage point behind last year but equal to the 5-year average. By August 2, fifty-four percent of the nation's cotton had begun setting bolls, 1 percentage point behind both the previous year and the average. As of August 2, forty-five percent of the 2020 cotton acreage was rated in good to excellent condition, 4 percentage points below the previous week and 9 points below the same time last year.

Sorghum: By August 2, fifty-five percent of the nation's sorghum acreage had reached the headed stage, 13 percentage points ahead of last year but 1 point behind the 5-year average. Eighty-four percent of Texas' sorghum acreage had reached the headed stage by August 2, three percentage points ahead of last year and 1 point ahead of average. Twenty-three percent of the nation's

sorghum was at or beyond the coloring stage by August 2, one percentage point ahead of last year but 3 points behind average. Fifty-five percent of the nation's sorghum was rated in good to excellent condition on August 2, two percentage points above the previous week but 13 points below the same time last year.

Rice: By August 2, fifty-nine percent of the nation's rice acreage had reached the headed stage, 4 percentage points ahead of the previous year but 9 points behind the 5-year average. On August 2, seventy-six percent of the nation's rice was rated in good to excellent condition, unchanged from the previous week but 8 percentage points above the same time last year.

Small Grains: Forty-nine percent of the nation's oat acreage had been harvested by August 2, twenty percentage points ahead of last year and 6 points ahead of the 5-year average. Harvest advanced 20 percentage points or more during the week in Iowa, Minnesota, South Dakota, and Wisconsin. On August 2, sixty-two percent of the nation's oat acreage was rated in good to excellent condition, 1 percentage point above the previous week but 3 points below the same time last year.

By August 2, barley producers had harvested 5 percent of the nation's barley crop, 2 percentage points ahead of last year but 7 points behind the 5-year average. On August 2, eighty-one percent of the nation's barley was rated in good to excellent condition, 1 percentage point above the previous week and 5 points above the same time last year.

By August 2, five percent of the spring wheat had been harvested, 3 percentage points ahead of last year but 5 points behind the 5-year average. Harvest progress was behind average in all six estimating states. Seventy-three percent of the nation's spring wheat was rated in good to excellent condition, 3 percentage points above the previous week but unchanged from the same time last year.

Other Acreages: By August 2, ninety percent of the nation's peanut crop had reached the pegging stage, equal to the previous year but 1 percentage point ahead of the 5-year average. On August 2, seventy-three percent of the nation's peanuts were rated in good to excellent condition, 1 percentage point below the previous week but 4 points above the same time last year.

International Weather and Crop Summary

July 26 - August 1, 2020

International Weather and Crop Highlights and Summaries provided by USDA/WAOB

EUROPE: Extreme heat compounded by short-term dryness adversely impacted summer crops in parts of western and southeastern Europe.

WESTERN FSU: Widespread, locally heavy showers and thunderstorms stabilized or improved conditions for reproductive to filling summer crops.

EASTERN FSU: Periods of rain further eased drought and stabilized spring grain prospects, while unseasonable showers were untimely for open-boll cotton in Kyrgyzstan and environs.

MIDDLE EAST: Sunny skies and near-normal temperatures maintained favorable yield prospects for filling summer crops in Turkey.

SOUTH ASIA: Unseasonably light showers prevailed across much of India and further limited soil moisture for crops in central growing areas.

EAST ASIA: Showers brought much-needed moisture to reproductive corn and soybeans in most of northeastern China.

SOUTHEAST ASIA: A tropical cyclone spawned widespread rainfall in the region, easing seasonal moisture deficits.

AUSTRALIA: Showers benefited winter grains and oilseeds in the east and some parts of the west.

ARGENTINA: Sunny skies aided winter grain development, but western production areas were in need of rain.

BRAZIL: Conditions favored corn and cotton harvesting.

MEXICO: Heavy tropical showers from the remnants of Hurricane Hanna inundated the northeast.

CANADIAN PRAIRIES: Warm, sunny weather spurred rapid spring crop development.

SOUTHEASTERN CANADA: Moisture remained limited for summer crops and pastures in parts of Ontario.

EUROPE

Extreme heat on top of acute short-term dryness adversely impacted summer crops in western and southeastern growing areas. After a recent spell of cool weather, temperatures soared into the upper 30s (degrees C) across much of western and southern Europe, with daytime highs reaching or topping 40°C in central and southern portions of France and Spain. The impacts of the heat on reproductive to filling summer crops were worsened by ongoing short-term dryness and drought; 30-day rainfall in key corn, soybean, and sunflower areas of western and southwestern France has tallied a meager 10 percent of normal or less, with 60-day rainfall locally less than 50 percent of normal. Similar dryness has also been reported across the southern half of Spain, necessitating higher-than-normal irrigation demands for reproductive to filling sunflowers, corn, and cotton while lowering the yield potential of non-irrigated summer crops.

Similar conditions have also been observed along and immediately south of the lower Danube River, with temperatures as high as 38°C coupled with short-term drought (30-day rainfall less than 10 percent of normal) trimming previously-favorable yield prospects reproductive to filling corn and soybeans in eastern Bulgaria and southern-most portions of Romania. Meanwhile, daytime highs spiked to 35°C on July 31 across southeastern England, though the short duration of the heat and recent near- to above-normal rainfall mitigated potential impacts on reproductive to filling spring grains and oilseeds. Elsewhere, scattered showers and thunderstorms (2-25 mm) from northern France into Poland and the northern Balkans maintained mostly favorable yield projections reproductive to filling spring grains and oilseeds as well as corn, sunflowers, and soybeans.

WESTERN FSU

Widespread, locally heavy showers stabilized or improved conditions for reproductive to filling summer crops, though locally dry weather prevailed in parts of Ukraine. A slow-moving cold front was responsible for 10 to 90 mm of rain from the Black Sea Coast northeastward across much of western Russia. As a result, the recent recovery in Russia from early-July heat and dryness continued, benefiting reproductive (north) to filling (south) corn and sunflowers, though summer crops in southern-most growing areas (North Caucasus District and immediate environs) likely suffered irreversible yield losses from the blistering heat during the first half of July. However, summer crop prospects across

the remainder of west-central Russia remained overall favorable, particularly in the Central District (a major corn producer). In Ukraine, which largely avoided the excessive early-July heat, showers and thunderstorms (2-40 mm) maintained overall favorable conditions for reproductive to filling corn, sunflowers, and soybeans. However, dry weather (less than 5 mm) in west-central Ukraine and northern Moldova continued to limit topsoil moisture locally, which may temper summer crop yield expectations somewhat. Temperatures averaged up to 2°C above normal for the week, though maximum temperatures remained near or below 35°C across most major growing areas.

EASTERN FSU
Total Precipitation (mm)
July 26 - August 1, 2020

EASTERN FSU

A slow-moving storm system and its attendant cold front brought widespread rain and cooler weather to the region's spring grain belt. Rainfall totaled 10 to 65 mm over northern Kazakhstan and central Russia, though locally less than 5 mm was reported in north-central Kazakhstan and neighboring portions of central Russia. The rain was particularly welcome in previously-dry portions of the southeastern Volga District, northwestern Kazakhstan (Kostanay), and the western Siberia District (Altai Krai). However, varying degrees of dryness and

drought lingered in the southern Urals District and environs (60-day rainfall less than 50 percent of normal). On top of the recent rain, cooler weather (up to 2°C below normal) helped stabilize conditions for spring wheat and barley following recent heat and drought. Farther south, mostly sunny skies and near-normal temperatures favored cotton development across Turkmenistan and Uzbekistan, while unseasonably heavy showers (10-50 mm) across Kyrgyzstan and neighboring locales were untimely for open-boll cotton.

MIDDLE EAST

Seasonably dry, warm weather prevailed across the region, promoting the development of Turkish summer crops. Sunny skies and a lack of extreme heat in Turkey favored filling corn, sunflowers, and cotton.

Satellite-derived vegetation health data continued to depict good to excellent yield prospects over nearly all of Turkey, and crops are past the key yield-determinant stages of development.

SOUTH ASIA Total Precipitation (mm) July 26 - August 1, 2020

SOUTH ASIA

Although widespread, monsoon showers remained unseasonably light throughout India. Rainfall totals were less than 25 mm in large portions of the country, limiting soil moisture for crops, particularly in central growing areas. Specifically, rice from Orissa to eastern Madhya Pradesh and oilseeds in western Madhya Pradesh and environs have experienced poor rainfall for

much of July (less than half of normal). More moisture is needed in August to prevent significant yield declines. In contrast, the remainder of the country has received favorable rainfall, boosting irrigation supplies for rice in the north and northeast (including Pakistan and Bangladesh) as well as keeping cotton well watered in the west and south.

EASTERN ASIA Total Precipitation (mm) July 26 - August 1, 2020

EASTERN ASIA

Showers returned to northeastern China, providing muchneeded moisture to reproductive corn and soybeans. After ill-timed dryness and heat during the early reproductive stages, 10 to 50 mm or more of rain eased stress on crops in most prefectures. However, even with the rainfall, temperatures continued to be up to 4°C above normal in some locales. In addition, a pocket of drier weather in western Jilin raised concerns over lower yield potential for corn. Farther south, showers (25-100 mm) on the North China Plain maintained favorable soil moisture for corn and other summer crops. Similar rainfall amounts occurred in the Yangtze Valley and most southern Provinces, and while flooding has likely abated in the lower Yangtze Valley, the area remained excessively wet. Elsewhere, heavy showers (50-200 mm) were reported across much of the Korean Peninsula and most of Japan, boosting moisture supplies for rice and other summer crops, but causing localized flooding.

SOUTHEAST ASIA Total Precipitation (mm) July 26 - August 1, 2020

SOUTHEAST ASIA

A tropical cyclone (Sinlaku) formed in the South China Sea late in the period, spawning widespread rainfall throughout the region. Much of Indochina into northeastern Thailand reported 50 to 100 mm (locally more) of rain, bringing much-needed moisture to rice areas experiencing lackluster monsoon rainfall.

The Philippines recorded similar rainfall totals (50-200 mm), benefiting rice and corn, particularly in the north where moisture deficits have been significant. Meanwhile, oil palm in Malaysia and Indonesia received 50 to 100 mm of storm-induced rain, keeping 90-day rainfall totals above to well-above average.

AUSTRALIA

Widespread showers (5-25 mm, locally near 50 mm) overspread eastern Australia, providing a needed boost in topsoil moisture for wheat and other winter crops in southern Queensland. The rain also benefited winter grains and oilseeds in New South Wales, helping to maintain good crop conditions throughout most of the state. In contrast, mostly dry weather (less than 5 mm) prevailed in Victoria and South Australia, further reducing the amount of water available to winter crops.

More rain would be welcome in these states to promote development of vegetative winter grains and oilseeds. In Western Australia, scattered showers (5-15 mm) favored wheat, barley, and canola in southern and western portions of the wheat belt, while drier weather covered northern and eastern areas. Temperatures averaged 2 to 3°C above normal in Western Australia and near normal (within 2°C of normal) in southern and eastern Australia.

ARGENTINA Total Precipitation (mm) July 26 - August 1, 2020

ARGENTINA

Sunny skies aided development of winter grains, though moisture was limited for germination in western production areas. Aside from a few stray showers (rainfall generally below 5 mm), the country's main agricultural areas were completely dry. Weekly temperatures averaged near to below normal, with highest daytime temperatures ranging from the upper 10s (degrees C) in southern Buenos Aires to the middle 30s in the

vicinity of Chaco and Formosa. Nighttime lows of -5°C were recorded as far north as Chaco. According to the government of Argentina, corn was 96 percent harvested as of July 30, 7 points ahead of last year. Wheat and barley were 96 and 93 percent planted, respectively. Winter grains were reported to be generally in good condition, though the need for additional moisture for the final stages of planting in Cordoba was noted.

BRAZIL
Total Precipitation (mm)
July 26 - August 1, 2020

BRAZIL

Conditions favored drydown and harvesting of corn and cotton in key production areas of central and southern Brazil. Rainfall totaling more than 5 mm was confined to Rio Grande do Sul and along the northeastern coast, where a few locations recorded more than 25 mm. Weekly temperatures averaged near to below normal; in Parana and Rio Grande do Sul, highest daytime temperature mostly ranged from the lower to upper 20s (degrees C). Nighttime lows dropped below 5°C in southern production areas but frost was likely confined to Rio

Grande do Sul, where crops were not susceptible to damage. According to the government of Parana, second-crop corn was 26 percent harvested as of July 27, with 82 percent of the remaining crop mature in development; more than half of the wheat had reached reproduction, and additional moisture would be welcome after several weeks of dryness. In contrast, wheat in Rio Grande do Sul had not reached reproduction as of July 29. Meanwhile, corn and cotton were 94 and 40 percent harvested, respectively, in Mato Grosso as of July 31.

MEXICO

The remnants of Hurricane Hanna generated widespread heavy showers over the northeast, increasing long-term moisture reserves but resulting in some flooding. Rainfall totaling 100 to 200 mm or more were recorded over northern Tamaulipas and neighboring locations in Nuevo Leon as the dissipating storm moved westward; similar amounts were recorded locally in southern Tamaulipas and eastern San Luis Potosi, with a broader area of the northeast recording at least 50 mm. Moisture from the storm remnants also contributed to rainfall in central Mexico, with

amounts totaling more than 100 mm in southern Durango; however, monsoon showers weakened from the previous week farther north, with only isolated heavy showers (greater than 50 mm) in Sonora and Chihuahua. Elsewhere, moderate to heavy rain (10-50 mm, locally higher) continued across the southern plateau (Jalisco to Puebla), with scattered showers extending from central Veracruz southeastward to Chiapas. However, pockets of dryness persisted in Veracruz and Tabasco, limiting moisture for sugarcane and other crops dependent upon summer rainfall.

CANADIAN PRAIRIES Total Precipitation (mm) July 26 - August 1, 2020

CANADIAN PRAIRIES

Warm, sunny weather fostered rapid development of spring grains and oilseeds. Little to no rain fell in the main agricultural districts, an exception being Manitoba's northwestern farming areas and adjacent locations in Saskatchewan where more than 10 mm was recorded. According to the government of Manitoba, excessive field moisture was still a problem in northwestern farming areas as of July 28. Elsewhere, the dryness was likely overall favorable

for cutting hay and helping to alleviate lingering wetness, although southwestern Saskatchewan was trending dry and additional moisture would have been welcomed to help crops fully fill. Weekly temperatures averaged near normal in the southeast, including most of Manitoba, and 3 to 5°C above normal in Alberta; daytime highs reached the upper 20s and lower 30s (degrees), locally reaching 35°C in from central Saskatchewan to southern Alberta.

Computer generated contours Based on preliminary gridded data

SOUTHEASTERN CANADA

Warm, mostly dry weather prevailed across Ontario, but locally heavy showers provided some relief from dryness in Quebec. Rainfall totaled more than 25 mm, locally reaching 100 mm, in Quebec and eastern-most agricultural districts in Ontario. In contrast, few locations elsewhere in Ontario

recorded more than 10 mm. Weekly temperatures averaged 1 to 3°C above normal across the region, with daytime highs reaching 30°C on several days. As corn and soybeans progress through reproduction, additional moisture will be needed to ensure current yield prospects.

The Weekly Weather and Crop Bulletin (ISSN 0043-1974) is jointly prepared by the U.S. Department of Commerce, National Oceanic and Atmospheric Administration (NOAA) and the U.S. Department of Agriculture (USDA). Publication began in 1872 as the Weekly Weather Chronicle. It is issued under general authority of the Act of January 12, 1895 (44-USC 213), 53rd Congress, 3rd Session. The contents may be redistributed freely with proper credit.
