THE FEED SITUATION

U. S. SUPPLY\* OF FEED GRAINS PER ANIMAL UNIT, AND NOVEMBER AVERAGE PRICES OF CORN, HOGS, AND BEEF STEERS AT CHICAGO

-----  
 T H E F E E D S I T U A T I O N  
 -----

Summary

Recent substantial advances in feed-grain prices reflect the influence of the drought throughout much of the mid-West, poor prospects for the 1940 winter wheat crop, and reduced supplies of fall and winter forage crops. The marked improvement in domestic industrial production and income of consumers during the past 2 months has also been a contributing factor.

In mid-December market prices of corn and barley were near the yearly peak which was reached in September, and the price of oats was not only above the September peak, but was also the highest since July 1937. Prices of all feed grains are now above the prices at this time in 1938, despite the larger supplies of corn and barley. High protein feed prices have advanced substantially since mid-October, while wheat millfeeds and gluten feed have advanced moderately.

The final estimate of the 1939 corn crop was 2,619 million bushels, making the total supply 3,180 million bushels, or 255 million bushels above that of last year and the largest total supply since 1932. The barley supply is also the largest in recent years, whereas the oats and grain sorghum supplies are considerably smaller than the supplies last year and much below the 1928-32 average. The total supply of these four feed grains available after October 1 is estimated to be about 110.5 million tons compared with 104.8 million tons last year and 101.1 million tons for the 1928-32 average. Taking into consideration increasing livestock numbers, the supply

:	Crops and Livestock is now available, and may be obtained	:
:	upon request from the Division of Economic Information,	:
:	Bureau of Agricultural Economics, Washington, D. C.	:

of feed grains per grain-consuming animal is estimated to be .81 tons compared with .82 tons for each of the past 2 years, and .73 tons for the 1928-32 average.

The 1939 hay supply, including stocks on May 1 and the December 1 estimated production, totaled 100.7 million tons, which was about 3 percent less than the total supply last year. The number of hay-consuming animal units on farms is slightly larger than a year ago, and the disappearance during the fall has probably been somewhat greater as a result of the drought. The carry-over of hay on May 1, 1940, therefore, is expected to be considerably smaller than the carry-over at the beginning of the present marketing year, and may not be much above the 1928-32 average.

Information received on the production of feed grains in European countries indicates that the oats and barley crops may be about the same as the production of these crops in Europe last year. The condition of the corn crop in Argentina is reported to be generally satisfactory, except in some areas where there has been considerable frost damage. The acreage seeded in Argentina is estimated to be somewhat larger than the acreage last year. United States exports of corn increased rather sharply following the outbreak of war, but have declined somewhat during recent weeks, and the total for 1939-40 is not expected to be larger than the total for 1938-39.

#### CORN

BACKGROUND.— The severe droughts in 1934 and 1936 resulted in acute feed shortages, and livestock numbers were reduced to about 12 percent below the 1928-32 average. High corn yields in 1937 and 1938 resulted in an above average production and unusually large supplies per animal in these 2 years. Stocks accumulated during these 2 years and were unusually large by October 1, 1939.

Corn prices declined sharply from the peak level reached early in 1937, and during most of 1938-39 they were near the level for the first half of the 1933-34 marketing year. Corn-livestock feeding ratios, which were very unfavorable during the drought years, became very favorable to livestock feeders during 1937 and 1938, but have tended to decline during the past year.

Slightly more "Free" corn

The final estimate of the 1939 corn crop was 2,619 million bushels, which, together with the carry-over of 561 million bushels, gives a total supply of 3,180 million bushels. Of the 561-million bushels carry-over, about 255 million bushels were under seal or held by the Government. Moreover, it is estimated that the quantity of 1939 corn sealed may be about as large as the quantity of 1938 corn sealed. In this event, the total quantity of corn remaining unsealed or not held by the Government in 1939-40 would be about 2,700 million bushels, or about 50 million bushels more than the supply of unsealed corn in 1938-39.

Although official figures are not available, it is probable that about 120 million bushels of the 255 million bushels of 1937 and 1938 corn sealed for loans have been turned over to the Government. The remainder, or around 135 million bushels, has been resealed on farms.

Large carry-over again in prospect

During each of the past 2 years the domestic disappearance of corn has averaged a little more than 18 bushels per grain-consuming animal unit. If the domestic disappearance of corn per animal unit should be the same in 1939-40 as in these 2 years, the expected 7 percent increase in the number of grain-consuming animal units would result in a total disappearance of corn of approximately 2,475 million bushels. This, however, would still be more than 100 million bushels smaller than the 1939 crop. Consequently, the carry-over of corn at the end of the present marketing year probably will be greater than the carry-over at the end of the 1938-39 marketing year.

The 1940 corn acreage allotment for the commercial corn producing area under the Agricultural Conservation program has been announced to be 36,638,000 acres, or about 4.5 million acres smaller than the allotment in 1939. On the basis of comparative returns of farmers who cooperated in the 1939 program and of those who did not cooperate, the percentage of farmers cooperating in the 1940 program is expected to be large - perhaps as large as in 1939. In this case there may be some reduction in corn acreage in the commercial corn area in 1940. On the other hand, some increase in acreage may occur in other areas.

Corn prices higher than a year ago

The weekly average price of No. 3 Yellow corn at Chicago advanced from 47 cents per bushel for the week ended October 8 to 56 cents per bushel for the week ended December 16. This compares with 51 cents for the week ended December 17, 1938. The average price received by Iowa farmers on November 15 this year was 40 cents per bushel as compared with 34 cents per bushel last year. Since the loan rate is practically the same, the spread between the Iowa farm price and the loan rate is about 6 cents narrower this year than in November 1938. This narrower spread reflects a larger number of farmers participating in the program and an improved domestic and foreign demand situation.

## OTHER FEED GRAINS

BACKGROUND.— Droughts reduced the production of oats, barley, and grain sorghums much below average in 1934 and 1936, and supplies of these grains were much below the normal domestic requirements of livestock. With more favorable seasons in 1937 and 1938, production was near or above average, and more than ample to meet domestic requirements. Prices of oats and barley declined sharply with the harvesting of the 1937 crops and moderately with the harvesting of the 1938 crops. During the greater part of the 1938-39 marketing year, oats and barley prices were near the 1933-34 level.

Small oats and grain sorghums crops; large barley crop

The December 1 estimate of the 1939 oats crop was 937 million bushels, 12 percent smaller than the production last year and — except for the 3 years, 1933, 1934, and 1936 — the smallest crop in over 25 years. The small oats supply this year has resulted in some imports of oats since July 1. The volume of oats imported, however, has not been sufficient to influence domestic oat prices. The December estimate of the grain sorghum crop was 83 million bushels, 16 million bushels below production last year, whereas the estimate of the barley crop was 276 million bushels, the largest since 1928.

Slightly smaller feed grain supply per animal

The total supply of feed grains on October 1 was 110.5 million tons compared with 104.8 million tons last year and 101.1 million tons for the 1928-32 average. This supply figure includes total stocks of corn and oats on October 1 plus production of corn, barley, and grain sorghums. The number of animal units on farms on January 1, 1940, probably will be around 136 million; the supply of feed per animal on October 1, therefore, was .81 tons compared with .82 tons in each of the past 2 years and .73 tons, the 1928-32 average. These figures include corn held by the Government and sealed for loans on farms.

Oats and barley prices

The small domestic oats supply this year, together with a stronger demand situation, has resulted in a substantial advance in oats prices since the first of the year. For the week ended December 16 the price of No. 3 White oats at Chicago was 41 cents per bushel, or 12 cents per bushel higher than for the corresponding week of 1938, and the highest since July 1937. Barley prices have been well maintained since the sharp rise following the outbreak of the European War. For the week ended December 16 the average price of No. 3 barley at Minneapolis was 52 cents per bushel, which compares with 50 cents per bushel for the corresponding week last year.

Byproduct feedsSupplies large

Upward revisions in the estimates of the soybean, flaxseed, and peanut crops since the release of the 1940 outlook report in early November indicate

that total supplies of high protein feeds for domestic utilization may be about 3,950,000 tons, or over 200,000 tons larger than the estimate given in the Outlook report. In 1938 the supplies of these feeds for domestic utilization were estimated at 3,454,000 tons, and during the period 1928-32 they averaged 2,307,000 tons. The prospective supply of wheat millfeeds available for domestic utilization in 1939-40 is expected to be about the same as the supply last year.

#### Prices higher than last year

Prices of byproduct feeds have been well maintained during the past month, and practically all types of millfeeds and high protein feeds are substantially above the late 1938 levels. The price of wheat millfeeds declined slightly from the middle of November to the middle of December. The price of cottonseed meal remained about steady during this period, while gluten feed and linseed and soybean meals advanced about \$1.50 per 100 pounds. Prices of wheat millfeeds are about \$2.00 to \$3.00 higher than at this time last year, and prices of high protein feeds are now around \$5.00 or \$6.00 higher, despite the considerably larger supplies of these feeds.

#### DEMAND FOR FEED GRAINS

BACKGROUND.— The demand for feed grains depends largely on the number of livestock on farms and the prices received for livestock and livestock products. The number of grain-consuming animal units on farms increased to 144 million on January 1, 1933, after which it declined to about 120 million by January 1, 1935. There was little change from this level during the following 3 years, but since January 1, 1938, livestock numbers have been increasing, and at the beginning of 1939 the number of grain-consuming animal units was 127 million.

During most of the period 1932-34, livestock prices were at the lowest level in more than 25 years. In late 1934 and early 1935 they improved materially, however, and continued at a much higher level during the period 1935-37. Livestock prices then declined from the middle of 1937 to 1939, and during much of 1939 were below the prices during the 2 preceding years.

#### The 1939 pig crop 19 percent larger

In the pig crop report released December 22 a 16 percent increase was estimated in the number of fall pigs saved this year as compared with the number saved in the fall of 1938. This, together with the larger spring pig crop, made the total 1939 pig crop about 19 percent larger than the 1938 crop. The figures tend to substantiate the early estimate of 136 million for the number of animal units on farms January 1, 1940. The pig crop report indicated that the 1940 pig crop would be smaller than that of 1939. Livestock numbers in general are now approaching the 1928-32 average, and the total number probably will not increase nearly so much in 1940 as in 1939.

Feeding ratios less favorable for livestock feeders

Hog prices declined about \$1.50 per 100 pounds from early in November to mid-December, whereas corn prices advanced about 7 cents per bushel. The hog-corn price ratio consequently declined from 13.7 early in November to 9.2 for the week ended December 16. This was the lowest ratio since July 1937. A hog-corn ratio below about 11.4 is usually considered unfavorable for hog producers, while a ratio higher than this is considered favorable. The beef-corn ratio has declined slightly during the past month, largely because of advancing corn prices. The margin between slaughter and feeder cattle is narrower than a year ago and is also somewhat narrower than average. This narrow feeding margin, together with higher corn prices, makes the cattle feeding situation somewhat less favorable than at this time last year.

The relationship between feed and butter prices is considerably less favorable for dairymen than it was at this time last year, and also less favorable than during the years 1928-32. Advancing feed prices during the past month have been accompanied by declining egg prices, and the feed-egg ratio early in December was less favorable than in November and also somewhat less favorable than at this time last year. The general effect of less favorable feeding ratios may be to reduce utilization of feed grains per grain-consuming animal unit somewhat during the coming winter and spring as compared with the corresponding periods of the past 2 years.

Commercial demand

Receipts of corn at nine primary markets during October-November totaled 56 million bushels compared with 75 million bushels during those 2 months of 1938 and 57 million bushels during those months of 1937. With the exception of these 2 years, however, receipts for October-November were the largest on record.

The quantity of corn used by the wet-processing industries during the 2 months, October-November, was slightly larger than in the corresponding 2 months last year. The quantity of corn and barley used in the production of distilled spirits and fermented malt liquors during the period July-September, also was a little larger than during those 3 months of 1938.

Corn and barley exports

Exports of corn increased from .3 million bushels in June to 1.9 million bushels in September and 5.6 million bushels in October, which was the largest monthly total since January 1939. This increase in exports is partly the result of small supplies remaining from the 1939 Argentine crop, and partly the result of higher shipping charges from the Southern Hemisphere. Total exports for 1939-40 are expected to be no larger than the 1938-39 exports, and they may be smaller. Exports of barley have increased since July, but for the period July-October they were much smaller than during the corresponding period of 1938.
