Agriculture

Washington, D.C.

Released June 30, 1995, by the Agricultural Statistics Board.

Corn Acreage Down 9 Percent
Soybean Planted Acreage Up 2 Percent

Corn planted for all purposes is estimated at 72.0 million acres, down 9 percent from last year. Soybean growers planted or intend to plant 63.1 million acres, up 2 percent from 1994. See additional commodity comments in Section B of this report.

The acreage estimates were based on surveys conducted between May 30 and June 13, 1995. Respondents were asked to report the total acres planted by crop, plus their intentions for the remaining acreage at the time of the interview. The survey indicated that 89 percent of the estimated 72.0 million acres of corn was planted at the time of the interview and that 52 percent of the estimated 63.1 million acres of soybeans was planted. The table below shows survey percent of acres planted this year compared with previous years.

Percent of U.S. and State Acreage Planted at Time of Interview

| MO | 49 | 22 | Oth Sts | 97 | 65 |
| | | | US | 89 | 52 |

The 1995 spring planting season developed into one of the latest on record. Frequent, heavy rainfall flooded low lying areas and kept soils too wet to plant. Most affected are the Dakotas and an area beginning in eastern Kansas and stretching northeast through Missouri, Illinois, and Indiana. More details on the weather impact can be found on page B-1.

Index is located at the end of this report. For information call (202) 720-2127. Office hours are 8:00 a.m. to 4:30 p.m. ET.

NASS will conduct follow-up surveys in late July. These are necessary due to the large acreage of soybeans and corn remaining to be planted as of the June survey, plus changes in the farm programs following the survey which allowed producers additional planting flexibility. Following normal NASS survey procedures, all respondents reporting acres of corn, soybeans, and sorghum, remaining to be planted in the affected States will be contacted to determine final plantings. Also, producers to be interviewed about their crop yield expectations will be asked to update the information they previously supplied about acres planted. The States to be resurveyed include IL, IN, IA, KS, MO, NE, ND, OH, and SD. The update survey will be conducted July 22 - August 3, 1995. If changes in the estimates of planted or harvested acres in this report are necessary, they will be shown in the August "Crop Production" report scheduled for release on August 11, 1995, at 8:30 a.m. ET.

Corn Acreage Down 9 Percent

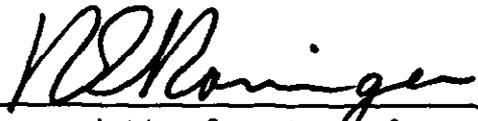

Corn planted for all purposes is estimated at 72.0 million acres, down 9 percent from last year. Growers expect to harvest 65.0 million acres for grain, down 11 percent from 1994. The acreage reduction requirement of 7.5 percent for participation in the feed grain program and abnormally wet planting season in parts of the corn belt account for most of the decline.

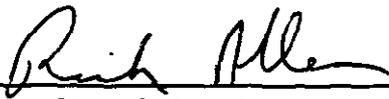

Soybean growers planted or intend to plant 63.1 million acres in 1995, up 2 percent from 1994. Spring planting got off to a slow start with 43 percent of the crop planted by June 4. This compares with 87 percent in 1994 and the average of 67 percent.

Other spring wheat plantings are 16.8 million acres, down 8 percent from 1994. Growers intend to harvest 16.4 million acres for grain, down 7 percent from last year. A cold, wet spring delayed, or prevented seeding of all the planned acreage.

All cotton acres are the largest on record since 1956, and at 16.6 million acres, up 21 percent from 1994. Upland cotton acreage accounts for 16.4 million acres, 21 percent above last year while American-Pima plantings totaled 189,000 acres, 12 percent above 1994. Planting progress lagged the average pace in several States, and replanting occurred in some Delta States, California, and Texas.

This report was approved on June 30, 1995, by the Secretary of Agriculture and the National Agricultural Statistics Service's Agricultural Statistics Board.

Acting Secretary of
Agriculture
Richard E. Rominger

Agricultural Statistics Board
Chairperson
Rich Allen

Crop Summary: Area Planted and Harvested,

1/ Area harvested forecasted for 1995.

2/ Crops included in area planted are corn, sorghum, oats, barley, winter wheat, rye, durum wheat, other spring wheat, rice, soybeans, peanuts, sunflower, cotton, dry edible beans, potatoes, and sugarbeets. Harvested acreage is used for all hay, tobacco, and sugarcane in computing total area planted. Includes double cropped acres and unharvested small grains planted as cover crops. Fall potatoes are carried forward from the previous year for current year totals.

3/ Crops included in area harvested are listed in footnote 2.

Spring Weather Review

Highlights: Severe flooding in California (in March) and the Central United States (in May) headlined a weather pattern that delivered winter-like conditions in early March and refused to let spring arrive in the North Central States.

The weather pattern in March was uncannily similar to that observed in January 1995: flooding struck California, and a sharp early-month cold outbreak was followed by an extended warm spell. After an early-April transitional phase, a new pattern locked in for the duration of the spring: strong storms tracked consistently across the Nation, soaking the Central States, but allowing the Southeast to become increasingly dry and warm.

March: Heavy precipitation fell west of the Rocky Divide, erasing vestiges of drought that had been so widespread and severe at the beginning of winter. In California, low-land flooding adversely affected vegetables and other ground crops.

Precipitation was variable and temperatures oscillated across the Plains, where the first days of the month featured extensive snow cover and bitter cold, such as the reading of -32 degrees in Aberdeen, SD on March 8. Only 3 days later, some of the warmest air of the **spring** arrived in the Plains, with temperatures up to 80 degrees F as far north as Pierre, SD. Farther east, warm weather predominated, and little precipitation fell after March 8.

April: The first of a procession of strong, slow-moving storms entered the West on April 7. Four days later, as the storm lifted northeastward, temperatures plunged into the lower and middle 20's from west-central Kansas to northern Texas, damaging winter wheat. Farther north, snow fell frequently, with monthly totals greater than 20 inches in some locations from Colorado to South Dakota.

Wet weather continued from northern California to the central Rockies, while wetness developed from the Central States south-southeastward to the Mississippi Delta. Very cool weather, with temperatures 4 to 8 degrees F below normal, exacerbated the effects of wetness from the central High Plains to the northern Plains and western Corn Belt. Farther east, warm, extremely dry weather persisted in the Southeast, while cool, dry conditions cloaked the Northeast.

May: The Nation's temperature gradient intensified, as a continuing parade of strong storms ran up against a strengthening ridge of high pressure across the Southeast. Rain finally tapered to showers by mid-month in northern California, but heavy precipitation continued through month's end from the Great Basin eastward into the Ohio Valley. In combination with the rain, temperature departures ranged from -4 to -7 degrees across the Central States, resulting in very slow planting progress and crop development.

Except for a small-scale torrential rain event in the central Gulf Coast region on May 8-10, hot, dry weather encompassed areas from extreme southern Texas to the Carolinas. Elsewhere, drier-than-normal conditions continued in the Northeast, while warm, dry weather overspread the Northwest.

General Crop Comments: Planting progress for Spring 1995 was one of the slowest on record for row crops. Wet, winter-like weather continued into Spring, preventing producers from preparing fields for planting. The Midwest endured cool, rainy weather that restricted planting. Rain-soaked fields and low soil temperatures in the Southeastern States hindered fieldwork early in the Spring. Later in the season, drought-like conditions in the Southeast slowed planting as producers waited for adequate soil moisture. Spring began in California with heavy rainfall that brought fieldwork to a standstill and flooded fields.

Warm weather in early March caused winter wheat to green quickly in the central Great Plains. Snow, early in the month, insulated winter wheat in the Northern States from a blast of cold Canadian air. Midwestern fields in early March were too wet to support farm equipment, while Texas wheat fields needed moisture. Continued rain in California saturated fields and delayed cotton planting in the San Joaquin Valley. Mild weather by mid-month in the Central States pushed the small grains development ahead of normal. Toward the end of March, snow across the High Plains brought much-needed moisture to wheat fields. Wheat in the Texas Plains needed moisture, but hot, dry weather continued until the end of the month. The month ended with wet, wintry weather in the Northern States that left fields saturated and delayed ground preparation. Fields dried enough for land preparation to begin in the Ohio Valley, but low soil temperatures prevented planting. By the end of March, field groundwork for cotton was in full swing in the Southeastern States, but the dry conditions prompted some producers to prewater cotton fields.

April began with frigid temperatures, limiting field preparation in the Midwest. Fieldwork was delayed in the Cornbelt by cool, cloudy, and wet weather that left soil temperatures too low to plant. Winter returned to the Northern States as temperatures dropped and removed hope of early-spring planting. A mid-spring freeze damaged wheat from Kansas to the Texas High Plains. Dry conditions in the Southeastern States continued to hamper spring planting and restrict germination. The middle of April left soil temperatures too cool in the Cornbelt to begin planting. Heavy rains in the Mississippi Delta curtailed planting progress and flooded low-lying fields. Continued cooler-than-normal weather and surplus soil moisture in the Midwest delayed corn planting. Saturated fields, combined with cold weather for late April, left fieldwork behind schedule for the Midwest and Northern States and yellowed wheat fields. Field activities in California slowly resumed as fields dried. Some cotton fields in California were replanted because low soil temperatures caused poor germination. By the end of April, scattered rains in the Southeastern States brought much-needed moisture, but many dry areas remained. Another spring-freeze hit Northern Kansas while low temperatures in the Texas High Plains may have caused additional damage to the already weakened wheat crop.

In May, numerous spring storms brought excessive moisture and cool weather to the central Great Plains and middle Mississippi Valley, leaving row crop planting progress behind normal for the month. For most of May, many Midwestern States reported fewer than 2 days suitable for fieldwork each week. The cool, saturated soils delayed row crop planting, and slowed developing of emerged crops. Soil conditions in the Southeast remained dry for most of the month, causing producers to delay planting. Later in the month, torrential rains

flooded fields in the Delta requiring some replanting. Recurring storm systems left surplus soil moisture conditions throughout the middle Mississippi Valley and northern Great Plains, further delaying row crop planting. Wet field conditions in the central Great Plains and middle Mississippi Valley increased foliar disease problems. Cloudy, cool, weather resulted in increased occurrences of foliar diseases in small grains across the central Great Plains to the Ohio Valley. Surplus soil moisture and low soil temperatures in the Great Plains slowed crop development and stalled planting. Persistent storm systems saturated fields in the western Corn Belt and stressed early emerged corn plants. Hot, dry weather continued throughout the month in the Southeastern States, causing some producers to replant due to poor germination. Continued damp fields stressed crops in the middle Mississippi Valley and flash flooding and standing water resulted in many fields being replanted. Cool weather for mid-May, in the Southern Great Plains, slowed cotton development. By mid-month, row crop and small grain planting progress was 2 to 3 weeks behind the average for many Midwestern and Northern States. Saturated fields in the Northern States left small grain seeding 3 weeks behind schedule, forcing some producers to change their planting intentions.

Corn: Corn planted for all purposes is estimated at 72.0 million acres, down 9 percent from 1994. Growers expect to harvest 65.0 million acres for grain, down 11 percent from last year. Most of the decline in corn planted acreage can be attributed to the acreage reduction requirement of the 1995 Feed Grain Program which changed from zero in 1994 to 7.5 percent in 1995. Excessive rains and flooding reduced intended plantings sharply in Missouri and South Dakota. Other States which had intended acreages reduced by the excessive rains and flooding included Illinois, Indiana, and Iowa. Farmers responding to the survey indicated that only 89 percent of the intended corn acreage had been planted at the time of the interview compared to an average of 97 percent planted. For most Illinois farmers this was the latest planting season in over 20 years. As of June 18, corn condition was rated 60 percent good to excellent compared to 77 percent last year at the same time. Several States had large acreages remaining to be planted at the time of interviews and some acreage could be switched to other crops.

Sorghum: Acreage planted for all purposes this year is expected to total 9.43 million acres, down 4 percent from 1994 and the smallest acreage devoted to sorghum since 1930. Area for grain, at 8.55 million acres is down 5 percent from a year ago to the lowest since 1953.

As of June 18, planting progress had reached 71 percent completion compared with the 86 percent average. Kansas, Missouri, Nebraska, and Texas all trail last year's planting progress. Of the 4, only Texas equaled average.

Oats: Oats planted last fall and this spring totaled 6.44 million acres, down 3 percent from 1994 and the lowest acreage planted since estimates were first made in 1926. Increased seedings as a cover crop for acreage in the Feed Grain Program were more than offset by declines in North and South Dakota where wet fields prevented growers from seeding intended acreages this spring.

Growers intend to harvest 3.25 million acres for grain in 1995, down 19 percent from the 4.02 million acres harvested in 1994. If realized this would be the least oat acreage harvested for grain since records were first kept in 1866.

Barley: Barley seedings last fall and this spring totaled 6.80 million acres, down 5 percent from last year. This is the least acreage seeded to barley since planted acreages were first estimated in 1926. North Dakota continues to lead all States with 2.40 million acres seeded, which is 4 percent less than 1994. The area to be harvested for grain is expected to total 6.42 million acres, down 4 percent from last year. If realized this would be the least acreage harvested since 1903 when 6.23 million acres were harvested for grain.

All Wheat: Planted area for 1995 is estimated at 69.4 million acres; area for grain, 61.0 million. Both acreage levels are down 1 percent from 1994.

Winter Wheat: Growers planted 49.3 million acres, up slightly from both 1994 and the previously published 1995 estimate. Acres for grain is placed at 41.3 million, up 2 percent from the June 1, 1995 forecast and unchanged from 1994.

The increase of 2 percent in harvested acreage from the most recent forecast was based on indications from the mid-year acreage surveys which show a greater portion of the planted acres being harvested. The increase is mainly in the Hard Red Winter producing area from Texas north to South Dakota. Soft Red Winter wheat acres for harvest were lowered in the southeastern States.

Durum Wheat: Area planted for 1995 is placed at 3.27 million acres, up 15 percent from last year. Of this, 3.21 million acres are expected to be harvested for grain. Both levels would be the highest since 1990.

North Dakota's durum seeding started nearly three weeks late due to cool, wet conditions. May rains kept planting progress behind average until completion around June 20. As of June 18, 6 percent of the acreage was jointing compared to the 49 percent average. The emerged crop is rated in mostly good condition. Higher durum prices from a year ago have led to increased acres in Montana. Harvest in California's Imperial Valley is nearly complete. Protein and yield levels were equal or better than last year.

Other Spring Wheat: The 1995 planted area is estimated at 16.8 million acres, down 8 percent from 1994. Growers intend to harvest 16.4 million acres for grain, down 7 percent from last year. A cold, wet planting season prevented many farmers from seeding all the area they originally intended. This was especially true in South Dakota, North Dakota, and Minnesota. Estimates of planted acreage in these 3 States are down 900,000, 700,000, and 400,000 acres, respectively, from 1994. Montana's spring wheat is up 7 percent from a year ago. Acreage in the Pacific Northwest (Idaho, Oregon, and Washington) is up 19 percent from a year ago as a significant increase in Washington's acres more than offset the Idaho drop. Nearly all planting was completed by June 18.

Rye: Seeded area is estimated at 1.63 million acres, up 1 percent from 1994.

Area for grain is estimated at 414,000 acres, 2 percent more than last season. Most producing States are expecting to harvest areas for grain equal to or above the previous year. Oklahoma and South Dakota expect 10,000 acres increases. Six States are expecting to harvest fewer acres for grain. Of these, Georgia and Wisconsin are both down 10,000 acres.

Rice: Area planted to rice is estimated at 3.17 million acres in the six major producing States, 6 percent below 1994. Acreage decreased in all six States. Expected area for harvest is 3.11 million acres, down 6 percent from last year.

Area planted to long grain rice, representing 75 percent of the total, dropped 2 percent. Medium grain acreage decreased 16 percent and accounted for 25 percent of the total. The acreage planted to short grain varieties showed no change and continued to make up a small amount of the all rice total.

Rice planting got off to a good start in the six States and by June 4 most States had completed planting. Rice condition in mid-June was rated as mostly good.

Soybeans: Growers planted or intend to plant 63.1 million acres in 1995, up 2 percent from 1994. Area to be harvested is estimated at 62.2 million acres, up 2 percent from last year.

A wet spring caused some farmers to plant soybeans instead of corn across the midwest. Indiana and Iowa farmers planted 400,000 acres more than last year. South Dakota's acreage was up 350,000 acres from a year ago. Both Illinois and Minnesota increased 300,000 from 1994. Overall, growers in 11 States are planting more acreage this year than last, 14 States are planting less, and 4 States are estimating no change from 1994.

At the time of interview, farmers reported that only 52 percent of the soybean acreage had been planted compared to normal of 74 percent.

Peanuts: Producers planted 1.57 million acres of peanuts this year, down 5 percent from the 1994 planted area of 1.64 million acres and 10 percent below the 1993 acreage. Planted acreage declined from last year in all producing states except South Carolina, Virginia and Oklahoma where it remained unchanged. Area for harvest is estimated at 1.54 million acres, down 5 percent from the 1994 level of 1.62 million acres.

Southeast growers (Alabama, Florida, Georgia, and South Carolina) planted 926,000 acres, down 6 percent from last year and 12 below 1993. In Georgia, suitable conditions enabled producers to plant their peanut crop ahead of normal. The crop is progressing well with three-fourths of the acreage rated in good condition. Alabama's crop development is also running better than average. Planting was also completed earlier than normal. The crop emerged with full stands and is in mostly good condition. Planting of the Florida crop is

complete with near normal development. In South Carolina, dry soils slowed planting progress. By June 4, planting was 90 percent complete, which compares to a five-year average of 96 percent. The crop is in mostly fair to good condition.

Plantings in the Virginia-North Carolina region totaled 242,000 acres, slightly below last year and 2 percent below two years ago. Planting started slowly in North Carolina, but by late-May, progress was equal to average. Planting in Virginia is complete with normal planting progress. The crop is in good condition in the two state area.

In the Southwest (New Mexico, Oklahoma, and Texas), plantings are estimated at 397,000 acres, down 5 percent from 1994 and 8 percent below 1993. The Oklahoma crop was rated in mostly good to fair condition in early June. Plantings were 74 percent complete by June 18, with some replanting due to wet fields. Plantings in New Mexico were completed two weeks behind normal due to low soil temperatures and windy conditions, in early May. The crop is in good condition and progressing well, now. In Texas, plantings were over the half-way mark on June 18 and progressing ahead of schedule. Peanuts are generally in good condition, with some producing areas in need of moisture.

Sunflower: Planted area is estimated at 3.61 million acres in 1995, 1 percent above 1994 plantings. Oil type varieties total 3.10 million acres this year, 2 percent above 1994. Non-oil varieties were planted on 513,000 acres, down 2 percent from the previous year.

North Dakota continues to be the leading State with 1.55 million acres seeded. Sunflower planting in North Dakota was two weeks behind normal by May 21. Planting progressed rapidly during the first two weeks of June. By June 18, planting was 94 percent complete, about 10 days behind last year. Crop condition in North Dakota was mostly good by mid-June.

Flaxseed: Acreage seeded for 1995 is estimated at 213,000 acres, up 20 percent from 1994. Area for harvest is estimated at 206,000 acres, up 20 percent from last year.

In North Dakota, planting was underway by the middle of May, about one week behind normal. As of June 11, flaxseed was 68 percent planted compared to 99 percent for 1994 and the average. The crop was in mostly good condition with about 30 percent emerged.

Special Oilseeds: Planted area of canola is estimated at 459,000 acres, up 30 percent from 1994. Farmers intend to harvest 443,000 acres, up 30 percent from last year. Planted acreage of rapeseed is estimated at 4,600 acres, down 38 percent from 1994. Growers expect to harvest 4,200 acres, down 37 percent from a year ago. Area planted for safflower is estimated at 240,000 acres, no change from 1994. Area for harvest is expected to total 230,000 acres, up 1 percent from last year. Mustard seed growers planted 15,600 acres this year, up 15 percent from 1994. Harvested acres are estimated at 15,400, up 15 percent from 1994.

Cotton: Area planted to cotton in 1995 is estimated at 16.6 million acres, 21 percent above 1994 and 24 percent above the 1993 area. If this level is realized, it will be the largest planted acreage since 1956. Upland cotton is expected to total 16.4 million acres, up 21 percent from last year. Growers of American-Pima cotton also intend to increase their plantings by 12 percent to 189,000 acres.

Upland growers in the Delta States (Arkansas, Louisiana, Mississippi, Missouri, and Tennessee) planted 4.70 million acres. This total is a 15 percent increase from 1994, and up 12 percent from two years ago. During the planting season, precipitation caused Arkansas and Missouri producers to lag behind their average planting pace. Arkansas was one-fourth behind average in mid-May. By early June, fields had dried and progress equaled or exceeded normal. During May, some acreage was replanted in Mississippi and Arkansas as a result of excessive rainfall. Mississippi reported insect infestations and chemical applications were required. Although the majority of the region's crop was in fair to good condition in mid-June, 22 percent of the Louisiana acreage and 14 percent of Mississippi's acres were rated in excellent condition.

Texas and Oklahoma producers planted 6.67 million acres, a 15 percent increase from last year and 13 percent greater than 1993. Planting in Texas fell behind the 5-year average pace during the season. The Rio Grande Valley suffered from drought and beet armyworm infestations in June, and spraying operations were active in the Coastal Bend. West Texas plantings were delayed due to dry conditions, and in early June, heavy rains and hail required some replanting. Hail, high winds, and seedling disease affected the High Plains crop. On June 11, approximately 20 percent of the Texas acreage was in very poor to poor condition. In mid-June, Oklahoma plantings were 30 percent behind average, with less than half the crop seeded. One-fourth of the Oklahoma crop was in very poor to poor condition.

In the Southeast (Alabama, Georgia, North Carolina, and South Carolina), producers planted 3.23 million acres, up 57 percent from 1994 and nearly double the 1993 level. The region's plantings were generally ahead of the 5-year average, except in South Carolina where dry conditions slowed the entire planting season. In mid-June, regional seeding was complete. In late May, Alabama and Georgia reported 14 percent of the crop in very poor to poor condition and in South Carolina, one-third of the crop was rated poor to very poor because of insufficient rain. Early June gulf storms relieved these dry conditions and in mid-June, only 2 percent of Alabama and Georgia acreage was rated as poor with 98 percent in fair or better condition. Fourteen percent of North Carolina cotton was rated in excellent condition although 8 percent was rated poor.

Upland planted acreage in the Western States (Arizona, California, and New Mexico) is estimated at 1.60 million acres, a 9 percent increase from last year and up 12 percent from 1993. Arizona's seeding exceeded the average pace. In mid-May, 46 percent of the Arizona crop was reported in very poor to poor condition and 46 percent was in fair condition. Persistent cool temperatures continued to hamper development and in mid-June, 20 percent of the acreage was in poor condition. California's seeding was hampered by wet, cool weather which caused some replanting in the San Joaquin Valley. California producers seeded 60 percent of the acreage by May 7. One week later, 90 percent was seeded. Also in mid-June, all of California's crop was rated fair to good.

American-Pima plantings increased from 1994 in all States except Arizona. In that State, weather conditions were unfavorable for plant development which also led to some acreage being replanted. Arizona producers decreased acreage planted by 1,000 acres from last year. California's acreage is up 17 percent and New Mexico and Texas increased acreage by 4,000 acres and 3,500 acres, respectively. In California, the cool, wet weather also delayed germination and growth, and the crop is at least 3 weeks behind the average pace of development.

Hay: Producers expect to harvest 60.2 million acres of all hay in 1995, a 3 percent increase from the 58.7 million acres harvested one year earlier. Area harvested for alfalfa and alfalfa mixtures is expected to total 24.6 million acres, up 2 percent from 1994, while all other hay acreage is estimated at 35.6 million acres, 3 percent above last year. All hay harvested acreage is expected to decrease in some southeastern and northeastern States and also in Illinois, Nebraska, and Wisconsin. The largest increases are expected in the Southwest and Pacific northwest.

First cuttings are underway but lag the average in many States due to cool, wet spring weather. Crop condition is generally good throughout the Nation. Rains have led to deteriorated quality in areas scattered throughout the country and have caused some losses of windrowed hay.

Dry Edible Beans: Planted acreage of dry beans is estimated at 2.04 million acres this year, up fractionally from last year and 9 percent above two years ago. Acreage for harvest is forecast at 1.96 million acres, up 6 percent from a year ago and 21 percent above 1993. Acreage is higher in the Midwest and California and lower in the Mountain States and Texas.

Planting of dry beans started late across most of the country because of wet soils and heavy rains. Michigan and New York caught up during a dry period in June and are now ahead in development. New York could use some rain for germination. Michigan, in mid-June was 87 percent planted, 9 percentage points ahead of normal.

The Plains and Mountain States were late in both planting and growing progress. Nebraska dry bean plantings were 60 percent finished by June 18, well behind average. Emergence in North Dakota reached 87 percent by mid-June compared with 95 percent normally. The crop is doing well, rated mostly good to excellent. Colorado had some hail damage early in the month while farmers in Wyoming and Kansas were kept out of their fields by wet soils. The Northwest States are 1-2 weeks behind normal progress. California planted a few extra acres of dry beans because other crops were late or abandoned.

Sweet Potatoes: Planted area of sweet potatoes is estimated at 87,000 acres this year, up 1 percent from last year and 5 percent above 1993. Louisiana and Georgia are responsible for the increase, while California and North Carolina are down. Area for harvest is forecast at 83,600 acres, a 1 percent gain over last year and 4 percent above two years ago.

Trans-planting is later than it was last year and later than the five-year average. By mid-June, North Carolina planting was 81 percent finished compared

with 87 percent the year before. South Carolina growers were 64 percent along compared with nearly 80 percent last year. Planting progress in Louisiana was smooth but slowed by dry soils in the first half of June. Alabama growers are behind schedule. In California, cool spring weather slowed development, but recent hot days should move things along.

Summer Potatoes: Michigan and Minnesota summer potatoes are being moved into the fall season this year. Growers in the remaining 14 summer States planted 72,500 acres of potatoes in 1995, a decline of 2 percent from the last two years. Area for harvest is forecast at 70,500 acres, down 1 percent from last year but is 1 percent above two years ago.

Summer potato acreage is down in most States along the Atlantic and Gulf Coasts, with the exception of Delaware where acreage shifted from nearby Maryland. Colorado and California are also down slightly. Illinois, Nebraska, and New Mexico show acreage increases in the summer season from a year ago.

A good crop is expected along the Atlantic Coast. Harvest started on the Delmarva Peninsula in late June. The three State acreage is off 1,600 acres from last year but condition of summer potatoes was good in mid-June. Early Texas fields are being dug for the red market. New Mexico spring and early summer weather offered good planting conditions and the current crop is in fine shape as harvest nears. Missouri farmers have dug a few early chip fields for the summer season. In Illinois, recent warm weather made up for a slow, wet spring start. In Colorado, an early June rain and hail storm wiped out some acreage in Weld County after a wet spring slowed planting progress. The California summer crop is in good condition with no unusual problems.

Tobacco: The nation's total area of tobacco for harvest in 1995 is estimated at 685,870 acres, 2 percent above last year and 8 percent below 1993.

Flue cured acreage, at 395,000 acres, is up 10 percent from last year. Tobacco transplanting was completed nearly on schedule in the Southeast, but heavy rains from hurricane Allison increased disease problems and lowered tobacco condition ratings. Harvest in Florida and Georgia began in mid-June, but was interrupted by rains.

Burley acreage, at 248,300 acres, dropped 7 percent from a year ago. Burley transplanting was close to completion by mid-June but some washed out and flooded fields had to be reset. Slight insect and disease problems were reported in Kentucky as a result of continued humid conditions.

Dark fire-cured types are estimated at 16,890 acres, down 7 percent from a year ago. Transplanting in Virginia was on schedule with adequate soil moisture and favorable temperatures.

Acreage for cigar types is estimated at 9,750 acres, down 7 percent from 1994. Dry weather in the Northeast provided ideal planting conditions but required growers to begin irrigating. Planting in Wisconsin was delayed early in the season by wet fields and cool temperatures but finished on schedule.

Sugarbeets: Growers planted an estimated 1.44 million acres of sugarbeets for 1995, down 2 percent from last year. Planted acres decreased 16 percent in California, and 1 percent in Idaho and Michigan from last year. Growers in North Dakota reported an increase in planted acres of 1 percent while

Minnesota's planted acres remained virtually unchanged from the previous year. Heavy rains in California during January and March resulted in fewer acres being planted. Cool, wet weather slowed emergence in Colorado and Nebraska, where heavy rain and hail damaged many fields. Idaho producers suffered several late-season freezes that required many fields to be replanted. A cool, wet spring delayed planting in the North Dakota, Minnesota, and Michigan. Sugarbeet growers have increased acreage to offset the expected reduced yields.

Sugarcane for Sugar and Seed: Growers intend to harvest 926,200 acres of sugarcane in 1995, down 1 percent from last year. The decrease from last year in harvested acres resulted primarily from the decrease in Hawaii, offsetting increases in Florida and Louisiana. Sugarcane acres for harvest in Hawaii were down 22 percent from 1994, reflecting the closing of plantations in Hawaii. Some plantations in Hawaii will begin seasonal harvesting in 1995 rather than the traditional year round harvest to allow workers to harvest other diversified crops. Florida growers expect to harvest 445,000 acres, compared to 444,000 acres harvested in 1994. Louisiana had a favorable planting season last year that allowed sugarcane producers to plant all intended acres.

Reliability of Acreage Data in This Report

Survey Procedures: Estimates of planted and harvested acreages in this report are based primarily on surveys conducted during the first 2 weeks of June. These surveys are based on a probability area frame survey with a sample of over 14,500 segments or parcels of land (average approximately 1 square mile) and a probability list sample of over 70,000 farm operators. Enumerators contact all farmers who have operations within the sampled land segments and account for their operations. From these data, estimates are calculated. The list survey sample farmers are contacted by mail, telephone, or personal interviews for information on their operations. Responses from the list sample plus data from the area operations that were not on the sampled list are combined to provide another estimate of planted and harvested acreages.

Estimating Procedures: National, regional, State, and grower data were reviewed for reasonableness and consistency with general cultural practices, farm legislation, and historical estimates. The survey estimates were also reviewed considering weather patterns and planting progress. Each State Statistical Office submitted an analysis of the current, local situation to the Agricultural Statistics Board (ASB). Planted acreage estimates were based on both survey estimates and the historical relationship of official estimates to survey estimates. Harvested acreage estimates were based on survey estimates and the historical relationship between planted and harvested acres.

Revision Policy: Planted acreage estimates are subject to revision August 1, if actual plantings are significantly different than those reported in early June. Also, planted acreage estimates can be reviewed at the end of the season and again the following year, if there is new information that would justify a change. Harvested acres can be adjusted whenever a change is made in planted acres. In addition, harvested acres are subject to change whenever a production forecast is made. Estimates will also be reviewed after data from the 5-year Census of Agriculture, conducted by the Department of Commerce, are available. No revisions will be made after this time.

Reliability: The surveys used to make acreage estimates are subject to sampling and non-sampling type errors that are common to all surveys. Sampling errors for major crops generally are between 1 and 5 percent. Sampling errors represent the variability between estimates that would result if many different samples were surveyed at the same time. Sampling errors cannot be applied directly to the acreage in this report to determine confidence intervals since the official estimates represent information from several sources. The sampling errors from the 1995 area frame survey for U.S. planted acres were: barley 4.2 percent, corn 1.1 percent, upland cotton 2.9 percent, sorghum 5.6 percent, soybeans 1.2 percent, winter wheat 1.7 percent, and other spring wheat 3.3 percent.

Non-sampling errors cannot be measured directly but can occur due to planting intentions, incorrect reporting and/or recording, data omissions or duplications, and errors in processing. To minimize non-sampling errors, vigorous quality controls are used in the data collection process and all data are carefully reviewed for consistency and reasonableness.

A method of evaluating the reliability of production forecasts in this report is the "Root Mean Square Error", a statistical measure based on past performances. It is shown below for selected crops. This is computed by expressing the deviations between mid-year acreage estimates and the final estimates as a percent of the final estimates and averaging the squared percentage deviations for the 1975-1994, 20-year period. The square root of this average becomes statistically the root mean square error. Probability statements can be made concerning expected differences in current estimates relative to final estimates, assuming that factors affecting this year's estimate are no different from those of the past 20 years.

For example, the root mean square error for the corn planted estimate is 1.2 percent. This means that there are 2 out of 3 chances that the current acreage estimate of 72.0 million acres will not differ from the final estimate by more than 1.2 percent or approximately 864,096 acres. Chances are 9 out of 10 (90 percent confidence level) that the difference will not exceed 2.0 percent or approximately 1.44 million acres.

Also shown in the table is a 10-year record for selected crops of the difference between mid-year planted acres estimates and final estimates. Using corn again as an example, changes between the mid-year estimates and final estimates during the past 10 years have averaged 297,000 acres, ranging from 10,000 acres to 936,000 acres. The mid-year planted acres have been below the final estimate 5 times and above 5 times. This does not imply that this year the mid-year planted estimate is likely to understate or overstate the final estimate.

Reliability of Mid-Year Planted Acreage Estimates

| Crop | Root Mean Square Error | | | 10-Year Record of Differences | | | | | |
|---------------|-----------------------------|---------|----------------|--------------------------------------|-------|-------|-------------|-------------|-----------------|
| | 90 Percent Confidence Level | | | Between Mid-Year and Final Estimates | | | | | |
| | Percent | Percent | Thousand Acres | Average | Small | Large | Below Final | Above Final | Number of Years |
| Corn | 1.2 | 2.0 | 1,440 | 297 | 10 | 936 | 5 | 5 | |
| Sorghum | 3.2 | 5.6 | 528 | 411 | 10 | 1,060 | 3 | 7 | |
| Oats | 2.2 | 3.8 | 245 | 64 | 3 | 120 | 3 | 7 | |
| Barley | 2.8 | 3.9 | 265 | 179 | 10 | 907 | 5 | 5 | |
| Winter Wheat | .60 | 1.0 | 493 | 204 | 25 | 383 | 1 | 9 | |
| Spring Wheat | 1.4 | 2.4 | 403 | 88 | 0 | 300 | 4 | 5 | |
| Soybeans | 1.2 | 2.0 | 1,262 | 518 | 150 | 1,440 | 4 | 6 | |
| Upland Cotton | 2.6 | 4.6 | 755 | 194 | 35 | 369 | 3 | 7 | |

Report Features

The next "Acreage" report will be released in June 1996.

Listed below are the commodity specialists in the Crops Branch of the National Agricultural Statistics Service to contact for additional information.

C. Ray Halley, Chief (202) 720-2127

Field Crops Section

Bill Dowdy, Head (202) 720-3843
Dan Kerestes - Soybeans, Minor Oilseeds, Rice (202) 720-9526
Greg Preston - Sugar Crops, Tobacco, Weekly Crop Weather (202) 720-7621
Vaughn Siegenthaler - Rye, Sorghum, Wheat (202) 720-8068
Charles Van Lahr - Barley, Corn, Oats (202) 720-7369

Fruit, Vegetable & Special Crops Section

Stephen Ropel, Head (202) 720-3843
Arvin Budge - Potatoes, Dry Beans, Onions (202) 720-4285
Roger Latham - Cotton, Hay (202) 720-5944
Linda McMillan - Nuts, Grapes (202) 720-4215
Dave Mueller - Fresh and Processing Vegetables (202) 720-2157
Blair Smith - Citrus, Tropical Fruits, Maple Syrup (202) 720-5412
Barbara Soltes - Noncitrus Fruits, Peanuts (202) 720-7688
