Current National Drought Summary (July 9, 2019)

A broken, highly-variable rainfall pattern predominated across the Country. Most areas where conditions are often dry during the summer followed this pattern, with little or no precipitation falling across the Far West and the northern Intermountain West. Other areas receiving subnormal precipitation – generally only a few tenths of an inch – included north-central North Dakota, most of northeastern Minnesota, part of the Upper Peninsula of Michigan and adjacent Wisconsin, central and southern Texas, and many areas across Louisiana and Mississippi. Farther east, rainfall was highly variable across the Southeast from Alabama through the Carolinas. Most of this area recorded at least a few tenths of an inch of rain, and roughly half received at least an inch. The heaviest amounts (2 to locally 6 inches) were concentrated along the Georgia/Florida border and the coastal Carolinas while totals on the low side were somewhat more common in south-central and northeastern Alabama, northwestern and east-central Georgia, upstate South Carolina, and a stripe across interior western North Carolina.
