FARM PRODUCTION EXPENDITURES, 1975

HIGHLIGHTS

Total farm production expenditures during 1975 were \$81.8 billion, or 4 percent less than a year earlier. The 1975 average expenditure per farm was \$29,172, compared with \$30,167 in 1974.

* Expenditures for feed, at 15.1 percent, accounted for the largest portion of total expenditures. Rent expenditures were second at 9.8 percent; livestock and poultry expenditures ranked third at 8.9 percent; and expenditures for fertilizer, lime, and other conditioners followed at 8.3 percent.

Major Farm Production Expenditures as a Percent of Total Expenditures, 1974 and 1975

	<u>1974</u>	Percent	<u>1975</u>
Total Farm Production Expenditures	100.0		100.0
Feed	18.2		15.1 *
Livestock and Poultry	17.7		8.9 *
Seeds and Plants	2.5		3.0
Fertilizer, Lime, and Other Conditioners	6.7		8.3
Agricultural Chemicals	1.9		2.6
Fuels and Energy	4.4		5.5
Farm and Motor Supplies	5.2		6.9
Autos, Trucks, and Other Motor Vehicles	2.1		1.8
Tractors and Self-Propelled Machinery	4.4		4.5
Other Farm Machinery, Implements, and Equipment	3.6		4.8
Building and Fencing	5.1		5.4
Farm Services	6.2		6.3
Rent	8.2		9.8
Interest	4.7		5.8
Taxes	3.1		3.6
Wages and Contract Labor	6.0		7.7

* The 1975 expenditures for feed, livestock, and poultry may be understated due to the lack of any large feedlot operations in the sample tabulated.

GENERAL

This publication gives the detailed results of a survey of farmers' production expenditures in 1975 at the U. S. level and by economic class. The survey was financed jointly by the Economic Research Service (ERS) and the Statistical Reporting Service (SRS), with SRS collecting and summarizing the data. This was the fifth survey since work was initiated in 1972 to provide current production expenditure information.

EXPENDITURE CONCEPTS

Expenditures were recorded for goods and services purchased in the year in which the item was delivered or construction was completed, even though not completely paid for during the survey year. The entire expense for new construction and additions to farm buildings was recorded in the year in which the building was completed. Finance charges and interest on installment purchases, delivery and installation costs, and sales and excise taxes were included in the total expenditure. Net expenditures were recorded when trade-in-allowances or discounts were part of the transaction. For automobiles, trucks, tractors, and other motor vehicles, the net expenditures were determined by deducting the trade-in or discount from the total price. The same procedure was used for farm machinery, but only the net expenditure was recorded on the questionnaire. For taxes, the respondents were asked to report the amount due in the survey year whether or not payment was made during that year.

Several types of expenditures are applicable to both family living and farm production. Outlays for buying and operating automobiles and trucks were allocated by the percent of the total expense reported for the farm share. Expenditures for farm real estate taxes, mortgage interest, and legal and settlement fees in connection with purchases or sales of farm real estate were allocated to farm production. Expenses for fire, wind, and extended coverage property insurance for the operator's home and contents were not considered farm production expenditures. The landlord's share of expenses was also included in the farm production expenditures totals.

Data users should recognize that survey results presented in this SRS report will not be identical with estimates published in various reports by ERS because of survey variations and differences in definitions used for estimating expenditures for livestock, rent, depreciation, and other items. For example, farmers' expenditures for livestock in this bulletin represent the total cost of all cattle and calves, hogs, and sheep and lambs bought for feeding and breeding from all sources. ERS cost estimates are based mainly on interstate purchases of these livestock items by farmers. SRS rent expenditure estimates represent all cash and shares to landlords; ERS reports gross rent as cash, shares, and Government payments to the farm owners.

LIMITATIONS OF DATA

Data are shown in substantially the same detail as obtained from respondents. To provide some basis for evaluation of the survey results, coefficients of variation (C.V.'s) are shown for a selected group of items. The smaller the C.V., the greater the reliability in the estimate. Users are cautioned that the sampling error is likely to be quite large in those situations where expenditures are relatively small, and for items for which only a small percentage of the farms reported, or where expenditures vary greatly between farms.

Expenditure estimates are also influenced by nonsampling errors, which may be as significant as sampling errors. Nonsampling errors can be caused by enumerators, respondents, sample and questionnaire design, and field and office procedures. SRS made every effort to minimize these problems to maintain survey accuracy.

Some of the most prominent nonsampling errors or biases in expenditures surveys are:

- (a) Recall errors: The difficulty of respondents to accurately remember expenditures made during some previous period. Studies reveal that under-reporting expenditures is generally the case, although the degree among items is not uniform and on agricultural expenditures over-reporting may occur.
- (b) Reporting load effect: The failure of respondents to report expenditures accurately because of fatigue resulting from lengthy and complex questionnaires. Design of the questions and questionnaires was aimed at an orderly transition from subject to subject in the sequence in which respondents were most likely to recall the data.

- (c) Interviewer effects: Interviewers or enumerators may obtain different answers to the same question depending on how they ask the question and the degree of probing used to obtain a complete and accurate response. Training schools instruct enumerators to interview uniformly and to use probing techniques.
- (d) Reporting instrument effects are associated with the questionnaire employed. It is not feasible to have a questionnaire which lists the hundreds of items which farm operators purchase each year. Therefore, respondents were asked to report expenditures for several items in one question. The categories or groupings of items with appropriate examples are important in obtaining accurate reporting of expenditures.

SURVEY METHODOLOGY

SAMPLE DESIGN

A multiple frame sample design was used for the 1975 Farm Production Expenditure Survey, including an area frame and a list frame. The list frame consisted of a listing of sample units which were generally large farms that would require more capital and had more operating expenses than the average farm. The area frame consisted of a probability sample of farm operators living in selected land area segments. The land area segments were selected on a probability basis. The area farm operators included in the list frame were not sampled twice.

The area frame is a completed frame. That is, every parcel of land in the 48 contiguous States is included. When the area frame sample was drawn, each sample unit had a known non-zero probability of selection. The area frame alone could be used to produce estimates, but with large specialized farms it is not an efficient design. A multiframe sample was used to reduce cost and sampling errors.

DATA COLLECTION

All State survey supervisors attended a 3-day training school and then conducted similar sessions for local enumerators before field work started in February 1976.

Screening questionnaires were used to determine if respondents qualified as farm operators. Expenses for the farm, except certain ones paid by the landlord, were recorded on the farm operator questionnaire. A landlord questionnaire was used to obtain landlord expenses for insurance, property taxes, interest, fencing, seed, fertilizer and lime, construction and maintenance of buildings, and other improvements. Data were collected during February and early March by personal interview. The 1975 Farm Production Expenditure Survey is based on reports from about 5,700 farms.

DESCRIPTION OF THE FARM PRODUCTION EXPENDITURE SURVEY TABLES

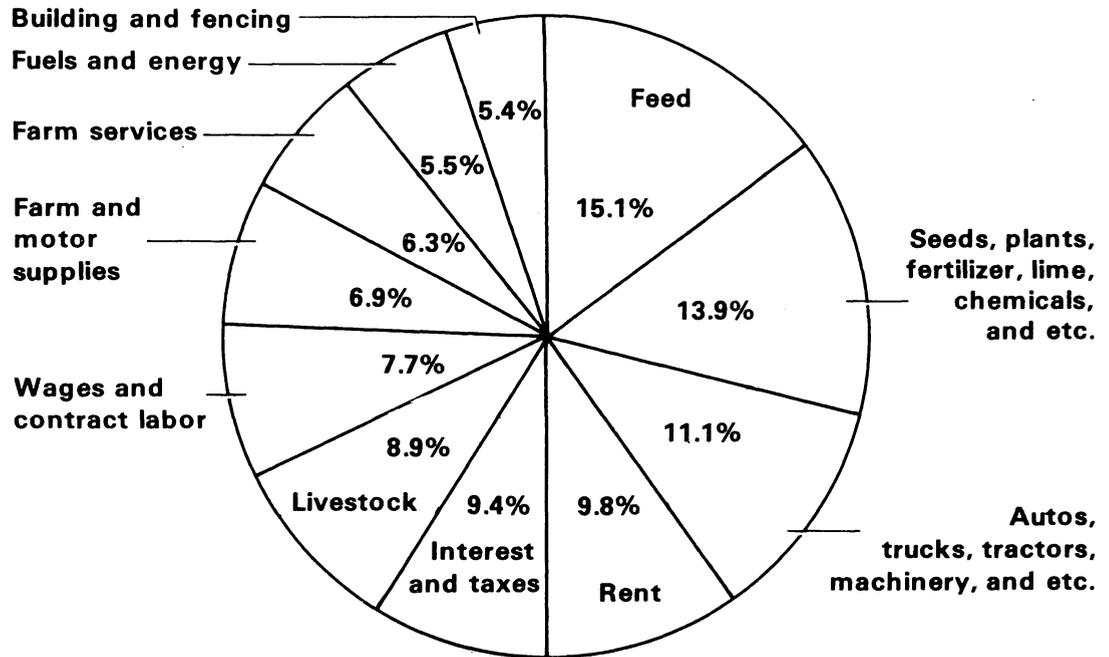

The following production expenditure tables include both landlord and operator expenses, and are designed to reflect all the costs incurred with farm production. Every attempt has been made to include only those expenses related to the farm or ranch and to exclude those items and expenses not related to the actual farm operation. Landlord expenditures are shown separately for only a few items.

The first set of tables shows U. S. totals and the remaining tables depict economic class at the U. S. level. Class breakdowns are based on gross value of sales from the farm or ranch and are as follows: Class 1 - \$100,000 and over; Class 2 - \$40,000-\$99,999; Class 3 - \$20,000-\$39,999; Class 4 - \$5,000-\$19,999; Class 5 - \$1,000-\$4,999; and Class 6 - less than \$1,000.

The tables contain data for (1) the percent of farms reporting the item, (2) the average expenditure per farm (expenditure divided by the official estimated number of farms - 2,803,880 excluding Alaska and Hawaii), (3) the total expenditure. The average expenditure for farms reporting purchases of a specified item can be calculated by dividing the average expenditure for all farms by the percent of farms reporting.
