1976 FARM PRODUCTION EXPENDITURES

HIGHLIGHTS

Total farm production expenditures during 1976 were \$89.2 billion, or 9 percent more than a year earlier. The 1976 average expenditure per farm was \$32,165, compared with \$29,172 in 1975.

Expenditures for feed, at 15.8 percent, accounted for the largest portion of the total. Rent expenditures were second, 9.1 percent; wages and contract labor ranked third, 8.3 percent; fertilizer, lime, and soil conditioners followed at 8.1 percent; with livestock and poultry a close 8.0 percent.

* Expenditures for feed, livestock, and poultry may be understated due to the lack of large feedlot operations in the sample.

INTRODUCTION

The results of the 1976 Survey of Farm Production Expenditures are presented in detail at the national level and by economic class, but without analysis. This survey was jointly financed by the Statistical Reporting Service (SRS) and the Economic Research Service (ERS). SRS collected and summarized the data.

Data users should be aware that the survey results in this publication are not identical with similar estimates published in various reports by ERS because of survey variations and differences in definitions used for estimating expenditures for livestock, rent, depreciation, and other items. For example, expenditures for livestock in this publication represent the total cost of livestock bought for feeding and breeding from all sources. ERS cost estimates for livestock are based mainly on interstate purchases by farmers. SRS rent expenses represent all cash and crop shares to landlords; ERS reports gross rent as cash, crop shares, and Government payments to farm owners.

SAMPLE DESIGN

A multiple frame sample design including land area and a list of names was used for the 1976 Survey of Farm Production Expenditures to minimize cost and sampling errors.

The list frame consisted of names of larger farms that were expected to have more than average operating expenses. The area frame consisted of a sample of farm operators living in sampled land area segments selected on a probability basis. Farm operators found in both frames were sampled only once.

The area frame is a complete frame in that every parcel of land in the 48 contiguous States has a chance of selection. The area frame itself could be used to produce estimates but it is inefficient when sampling for large specialized farms.

DATA COLLECTION

State survey supervisors attended a 2½-day regional training school and then conducted similar sessions for local enumerators who collected the survey data by personal interviews.

For each sample name or segment resident, a screening questionnaire was used to determine if the respondent qualified as a farm operator. Expenses for the farm or ranch, except certain ones paid by the landlord, were recorded on the farm operator questionnaire. A separate questionnaire was used for each landlord from which the operator rented land in order to obtain the landlord share of expenses for seed, fertilizer, lime, pesticides, new construction and maintenance of buildings and other improvements, insurance, taxes, interest, and fencing.

Expenditure data were recorded for goods and services delivered or partially delivered during the year even though full payment was not made during the survey year. The expenses for new farm building construction or additions to farm buildings were recorded only if the buildings were completed during the survey year. Any sales tax, excise tax, shipment or delivery charges, finance or carrying charges, or installation charges were included in the total cost. Only net costs were recorded when trade-in-allowances or discounts were part of the transaction, except for automobiles, trucks, and tractors. The net costs were determined for these items after deducting the recorded trade-in-allowances or discounts from the recorded total prices. For taxes, the respondents were asked to report the amount due in the survey year whether or not payment was made in that year.

Expenditures applicable to both farm production and family living were allocated completely or by the reported farm share percent to farm production. Outlays for buying and operating motor vehicles, utility expenses, liability and building insurance were allocated by the percent of the expenses reported for the farm share. Expenses for farm real estate taxes, mortgage interest, and legal and settlement fees in connection with buying or selling farm real estate were allocated completely to farm production.

TABULATION

The expenditure tabulations are based on reports for about 4,900 farms and ranches. They include operator and landlord expenses for the farm or ranch and reflect only the costs incurred with farm production. A few of the most common landlord expenditures are shown separately.

The percent of farms reporting and the average expenditure per farm were calculated by dividing the number of farms reporting, or total expenditure, by the official estimated number of farms - 2,773,780 - excluding Alaska and Hawaii. The percentages and averages for the economic class data were obtained by dividing the number of farms reporting or total expenditure, by the number of sample farms within each class.

The economic classes for farms shown in these tabulations at the U.S. level were determined from the gross value of sales reported in the survey: Class 1 - \$100,000 and over; Class 2 - \$40,000-\$99,999; Class 3 - \$20,000-\$39,999; Class 4 - \$5,000-\$19,999; Class 5 - \$1,000-\$4,999; and Class 6 - less than \$1,000.

LIMITATIONS OF THE DATA

The survey results are shown in substantially the same detail as obtained from respondents. Because survey results are estimates of the total population based on a sample, they may differ somewhat from the figures obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. The results of any survey are subject to sampling variability and nonsampling errors.

Sampling variability, or errors, expressed as a percentage of the estimate, (coefficients of variation or C.V.'s) are shown for a selected group of items. The chances are about 68 out of 100 that the actual population value for an item is between 95 and 105 percent of the value shown when that item has a C.V. of 5 percent. The chances are 19 out of 20 that the population value for this same item is between 90 and 110 percent of the survey result. The smaller the C.V. the greater the reliability of the estimate. Coefficients of variation provide some basis for evaluating the survey results.

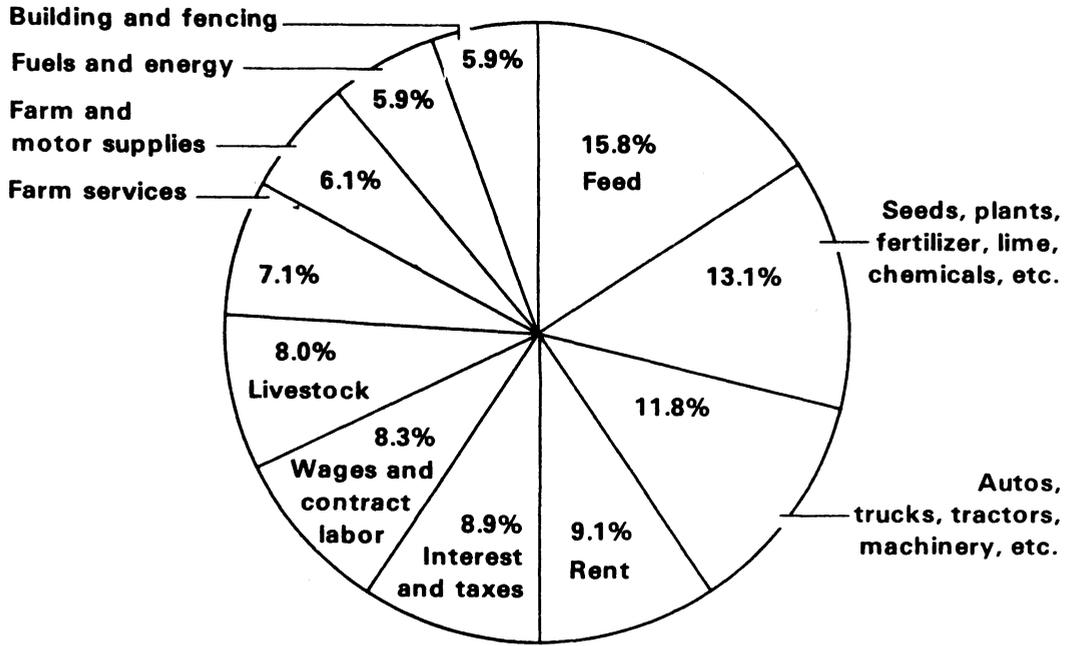

Users are cautioned that the sampling errors are likely to be substantial for items purchased infrequently, or for items reported by a small percentage of farms or where expenditures vary greatly among farms.

Expenditure estimates are also influenced by nonsampling errors, which may be as significant as sampling errors. Nonsampling errors may be introduced by enumerators, respondents, sample and questionnaire design, and field and office procedures. SRS made every effort to minimize these problems to maintain survey accuracy. The most prominent nonsampling errors or biases in expenditure surveys are:

- (a) Recall errors: The difficulty of respondents to accurately remember expenditures made during some previous period. Studies reveal that under-reporting expenditures is generally the case, although the degree among items is not uniform and on agricultural expenditures over-reporting may occur.
- (b) Reporting load effect: The failure of respondents to report expenditures accurately because of fatigue resulting from lengthy and complex questionnaires. Design of the questions and questionnaires is aimed at an orderly transition from subject to subject in the sequence in which respondents are most likely to recall data.
- (c) Interviewer effects: Interviewers or enumerators may obtain different answers to the same question depending on how they ask the question and the degree of probing used to obtain a complete and accurate response. Training schools are held to instruct enumerators to interview uniformly and to use probing techniques.
- (d) Reporting instrument effects are associated with the questionnaire employed. It is not feasible to have a questionnaire which lists the hundreds of items that farm operators or ranchers purchase each year. Therefore, categories or groupings of items with appropriate examples are important in obtaining accurate reporting for expenditures when combination questions are asked.
